THE OLDEST AND BEST ENGLISH ELECTRICAL JOURNAL.

EVERY FRIDAY, PRICE 4d., POST FREE 4½d.

THE ELECTRICIAN.

"THE ELECTRICIAN" was originally established in 1861, in a form similar to the present publication, and after occupying a leading position amongst scientific journals for a period of about three years, was discontinued, not, however, before it had become apparent that such a publication occupied an essential place amongst the scientific and technical journals.

From 1864 to 1878 was a period during which the absence of "THE ELECTRICIAN was much felt, no weekly paper efficiently serving the interests of the electrical profession being then in existence; and, as has frequently been the case, it was left for gentlemen taking a keen interest in the applications of electricity to telegraphic purposes, which were at that time the principal electrical industries, to resuscitate "THE ELECTRICIAN," and once again establish it as the recognised leading organ of electrical science and industry. It will thus be seen that "THE ELECTRICIAN" is the oldest electrical journal published. Since its second advent, and especially since the end of the year 1887, "THE ELECTRICIAN" has made rapid progress, and has continued to record in a full and thorough manner all the great discoveries and experiments in electrical science, and to illustrate how these can be commercially applied and profitably worked. In the volumes of "THE ELECTRICIAN" will be found a most valuable collection of original papers and articles by nearly every leading electrical writer of note, including:—

Prof. W. G. Adams,
Mr. G. L. Addenbrooke,
Sir James Anderson,
Mr. L. B. Atkinson,
Prof. W. E. Ayrton,
Prof. W. F. Barrett,
Mr. Shelford Bidwell,
Mr. T. H. Blakesley,
Mr. C. Vernon Boys,
Major P. Cardew,
Mr. E. T. Carter,
Mr. R. E. Crompton,
Prof. W. Crookes,
Prof. J. Dewar,
Mr. W. B. Esson,
Mr. Sydney Evershed,
Prof. J. A. Ewing,
Mr. C. A. Faure,
Mr. Desmond G. FitzGerald
Mr. Clarence Feldmann,
Dr. J. A. Fleming,
Prof. George Forbes,
Prof. W. Garnett,
Mr. W. Geipel,
Dr. Gladstone,
Prof. R. T. Glazebrook,
Dr. George Gore.
Mr. Oliver Heaviside,
Prof. von Helmholtz,
Dr. H. Hertz,
Mr. Paget Higgs,
Dr. Edward Hopkinson,
Dr. John Hopkinson,
Prof. E. J. Houston,
Prof. D. E. Hughes,
Mr. Gisbert Kapp,
Prof. A. B. W. Kennedy,
Mr. A. E. Kennelly,
Dr. Oliver Lodge,
Prof. J. Clerk Maxwell,
Prof. Mengarini,
Mr. W. M. Mordey,
Dr. Alex. Muirhead,
Prof. John Perry,
Mr. W. H. Preece,
Mr. S. Tolver Preston,
Mr. J. S. Raworth,
Lord Rayleigh,
Prof. Rowland,
Prof. Rücker,
Mr. Warren de la Rue,
Sir David Salomons,
Dr. Paul Schoop,
Mr. Louis Schwendler,
Mr. G. F. C. Searle,
Mr. J. S. Sellon,
Mr. Alex. Siemens,
Dr. Werner Siemens,
Mr. M. Holroyd Smith,
Mr. Willoughby Smith,
Mr. Albion T. Snell,
Mr. W. H. Snell,
Mr. J. W. Swan,
Dr. W. Spottiswoode,
Mr. J. T. Sprague,
Prof. Balfour Stewart,
Dr. W. E. Sumpner,
Mr. James Swinburne,
Mr. Nikola Tesla,
Prof. Silvanus Thompson,
Mr. Elihu Thomson,
Prof. J. J. Thomson,
Sir Wm. Thomson (Lord Kelvin),
Mr. H. Tomlinson,
Mr. A. P. Trotter,
Mr. G.W. de Tunzelmann
Prof. John Tyndall,
Mr. F. C. Webb,
Mr. F. M. Weymouth,
Mr. H. D. Wilkinson,
Mr. Norman F. Wilson,
Dr. Zetzsche,
&c., &c., &c.

And all papers read before the principal Electrical Institutions throughout the world by men eminent in the Electrical Profession have been given, together with authenticated reports of the discussions thereupon.

In addition to the above, "THE ELECTRICIAN" forms a complete record of all the important legal investigations which have occupied the attention of the Courts of Justice for the past 14 years, and it is customary for "THE ELECTRICIAN" to occupy a prominent position in the Courts as an authority upon all questions affecting the Electrical Profession. In this connection it is only necessary to point to the actions which have arisen from time to time upon the Edison and Swan Patents, the Compound Winding Patents, the High and Low Tension Systems, the Accumulator Patents, the Telephone Patents, etc., etc., in which "THE ELECTRICIAN" has figured as a reliable authority, and has been put in evidence and accepted by the parties concerned.

A regular feature in "THE ELECTRICIAN" has always been the verbatim reports of meetings of Electrical Companies and Corporations, and while "THE ELECTRICIAN" has never trenched upon the grounds legitimately occupied by the financial journals, the information of a financial character given from week to week in its columns is full, reliable, and absolutely unbiassed. It has no interest whatever in any financial schemes, and is devoted entirely to the interests of the profession it was established to serve. "THE ELECTRICIAN" gives full reports of Meetings, &c., held on Thursdays, so that subscribers interested obtain their copies by Friday morning's post.

The original articles appearing in "THE ELECTRICIAN" are written by gentlemen having no interest whatever in particular electrical systems, and with but one object, and that the advancement of electrical knowledge and electro-technology generally. Many of these original series of articles have since been revised by their authors, and published in book form. These form the nucleus of the well-known "**Electrician" Series**, of which further particulars will be found elsewhere.

Numbering as it does amongst its writers the leading thinkers and workers of the day, it has also subscribers in all parts of the world, and reaches a larger *clientèle* than any journal of the kind in the English language. Its volumes end in May and November, and form the most complete record of electrical science, experiment and discovery that can be found in any language.

Finally, "THE ELECTRICIAN" has been of incalculable service to technical education, and has done much to make the general study of electricity the reality it has undoubtedly become. No aspirant to honour and renown in the electrical profession can hope to keep abreast of the never-ceasing stream of discoveries of new applications of electrical science to every day commercial pursuits who does not diligently peruse the columns of "THE ELECTRICIAN," which is pre-eminently the leading electrical journal.

TERMS OF SUBSCRIPTION:

	YEAR.	HALF-YEAR.	QUARTER.

ANTI-SULPHURIC ENAMEL.

Used by the Leading Electricians throughout the World.

Supplied to Her Majesty's Government and Leading Railway Companies, &c., &c.

RESISTS ACID SPRAY, ACID FUMES AND GASES.

Unaffected by Moisture, Oil, Sea Water, or Steam.

Report from SIR DAVID SALOMONS, BART., M.A.—"Your Anti-Sulphuric Enamel is most useful to me. I employ it in and out of the Accumulator House for a variety of purposes. The Enamel is not only proof against acids and damp, but, drying fast, it serves for purposes where paint would be unsuitable.

ANTI-SULPHURIC ENAMEL.

For Coating Walls, Ceilings, Stands, and Fittings in Accumulator Houses.

„ **Cables, Wires, Casings, Magnets, Switch-boards.**

„ **Switch-Handles, Trays for Cells, Positive and Negative Poles.**

„ **Engines, Pumps, Signal-arms, Dials, Underground Cable Joints.**

„ **Mining Lamps, Wooden Cells, Battery Jars, Terminals, Carbons, &c.**

„ **Ventilating Fans in Chemical Factories, Coal Mines, &c.**

Anti-Sulphuric Enamel is a Perfect Insulator for Dynamos, Cables, &c.

SUITABLE FOR ANY WORK REQUIRING A FINE FINISH.

Messrs. CROMPTON & Co., Ltd., report as follows:— March 7th, 1891.

"I have great pleasure in stating that the Anti-Sulphuric Enamel you have supplied to us for coating wood-work, and copper-work, has in every case proved most successful. Our experience of its use extends over nearly two years, and so far, there is no appearance of the acid having attacked the metal beneath the enamel." (Signed) R. E. B. CROMPTON, Managing Director.

By the use of ANTI-SULPHURIC ENAMEL, BATTERY CELLS ARE NOW BEING MADE OF WOOD.

The Weymersch Electric Battery Syndicate say—"Three coats of your Enamel on the bare wood (our batteries are made of teak), are quite sufficient protection against the acid solution used in the battery."

Kensington and Knightsbridge Electric Company say—"We find that it affords a perfect protection against the destructive action of the spray which is thrown off from the accumulator cells during their working." (Signed) H. W. MILLER, Resident Engineer.

ANTI-SULPHURIC ENAMEL SUPPLIED READY FOR USE.

Black, Oxide, Purple Brown, Transparent. 18s. per gal.; Vermilion, 25s per gal. Yellow, Buff, Dark Green, 20s. per gal.

SPECIALITIES FOR THE ELECTRICAL TRADE.

"Vitros" Enamel stands boiling water or dry heat. Lacquers (coloured) applied cold or hot. Oxidized Enamel Paints (Balloon Brand) finest quality. Shellac Varnishes.

FLEXIBLE SHELLAC INSULATING VARNISH.

Lustre Liquid for Preventing Rust or Tarnish on Metals, (applied cold).

Full particulars and quotations for quantities on application.

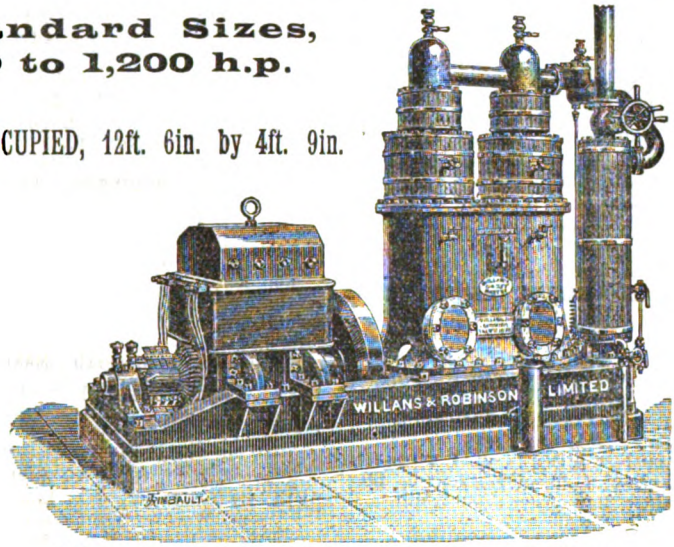
WILLANS CENTRAL VALVE ENGINES

Standard Sizes,
30 to 1,200 h.p.

SPACE OCCUPIED, 12ft. 6in. by 4ft. 9in.



200 H.-P. ENGINE COUPLED DIRECT TO DYNAMO.

SIMPLE COMPOUND OR TRIPLE EXPANSION.
EXTREME ECONOMY OF STEAM AND OIL.
GREAT DURABILITY AND FREEDOM FROM REPAIRS.
SILENT RUNNING. LITTLE ATTENDANCE REQUIRED.
HIGH SPEED AND SMALL SPACE OCCUPIED,
And consequent reduction in first cost of dynamos and buildings.
All parts to gauge and interchangeable.

OVER 76,000 H.P. IN USE OR ON ORDER.

Of this over 40,000 is for Public Central Station Lighting in the United Kingdom alone.

G. E. BELLISS & Co., Ltd.,

LEDSAM STREET WORKS, BIRMINGHAM.

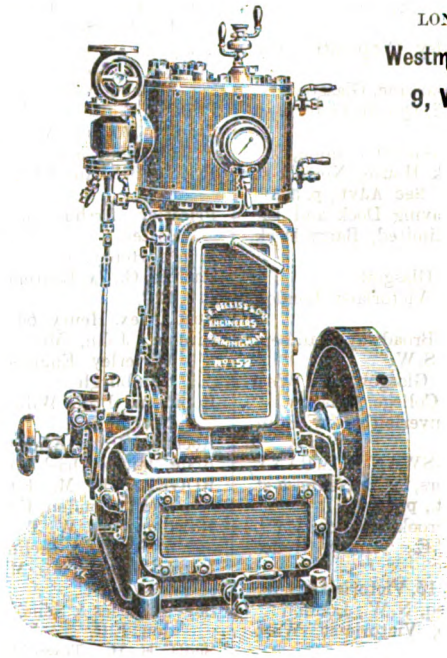
ESTABLISHED 1852.

TELEGRAPHIC ADDRESS: "Belliss Birmingham."

Manufacturers of

ELECTRIC LIGHT ENGINES AND BOILERS,

AND COMPLETE STEAM EQUIPMENT FOR CENTRAL STATIONS.



Self-Lubricating High-Speed Engine.

LONDON OFFICE:
Westminster Chambers,
9, Victoria Street,
S.W.

SPECIALITY

HIGH-SPEED Vertical OPEN OR ENCLOSED ENGINES FOR Driving Dynamos Direct.

Numerous Engines on this principle, both Simple and Compound, have been already supplied by us for Central Electric Light Installations, Steamship Companies and Private Plants.

ADVANTAGES of our Self-Lubricating Engine.

SIMPLICITY.—Being ordinary Double-Acting Steam-Engines, single, compound, or triple, they are simply constructed, and not liable to get out of order. They are closed in only to ensure liberal lubrication and freedom from dirt.

ECONOMY.—The high-speed and effective lubrication combine to render this Engine one of the most economical for Electric Light purposes in the market.

STEADY RUNNING.—Owing to the Double-Action, this Engine governs much more effectively than any single-acting engine can, and with our compound type with single valve, the governor acting on both slides at once, controls very powerfully, and gives a great advantage where the loads are liable to large variation.

QUIETNESS.—The oil is forced between all working surfaces with a pressure sufficient to prevent any possibility of knocks when the engine is working with light or heavy loads.

DURABILITY.—The oil is pumped continuously through all the bearings, returning to the pump to be used over again for long periods, and as the oil is kept at a pressure between the surfaces the latter are not permitted to come together, and practically no wear takes place, Engines of the type running for nearly twelve months, when taken apart showing scarcely a sign of having been at work. In single-acting Engines, the working parts being always under compression, only one half the possible bearing surface is available, whilst the lubrication is much less effective, and the wear consequently much greater, than with the alternate action of our Engine.

Estimates free on receipt of particulars. Before ordering write for Catalogue.

"The Electrician" *is the leading English Electrical Journal, and numbers among its Subscribers and Advertisers all the great Electrical firms.*

Its columns contain from week to week important original Series of Papers on Electrical subjects, written by the leading Electrical Experts, all fully Illustrated.

"The Electrician" *is owned by gentlemen well known in the Electrical World, having absolutely no financial or professional interest in any electrical schemes whatever. Its opinions on matters of concern to the Profession are, therefore, unbiassed and of value.*

"TRADE NOTES" *(each issue) give in a condensed and handy form details of Contracts Open and Tenders Received, and of the proceedings of Local Authorities throughout the kingdom in reference to Electrical matters. Financial Notes of interest to the Profession are a feature of each issue.*

"The Electrician" *has a larger circulation* (GUARANTEED) *than any other English Electrical Journal, and offers exceptional facilities to Advertisers for reaching the entire Electrical and Allied Trades throughout the world. Advertisers reach the entire Trade by this medium*

"ELECTRICIAN" SERIES, THE, of Electrical and Scientific Books (all fully illustrated), published at the Offices of "THE ELECTRICIAN," 1, 2, and 3, Salisbury-ct, Fleet-st, London, E.C. The Series at present comprises the following:—

"The Electrician" Electrical Trades' Directory and Handbook. Published yearly at the end of January. Established 1883. A very valuable advertising medium, covering the entire Trade. Subscription Price 5s., postage 9d. extra; after date of publication, 7s. 6d., postage 9d. extra. Postage abroad 1s. 4d. *Digest of Contents sent free on application.*

Electromagnetic Theory. Vol. I. By Oliver Heaviside. Price 12s. 6d., post free 13s.

The Alternate Current Transformer in Theory and Practice. By Prof. J. A. Fleming, M.A., D.Sc.

VOL. I.—THE INDUCTION OF ELECTRIC CURRENTS. Price 7s. 6d., post free 8s.

VOL. II.—THE UTILISATION OF INDUCED CURRENTS. Price 12s. 6d., post free, 13s.

Magnetic Induction in Iron and other Metals. By Prof J. A. Ewing, M.A., B.Sc., F.R.S., F.R.S.E. Price 10s. 6d., post free 11s.

A German Edition is also published, price 8s. 6d., post free, 9s.

A Pocket Book of Electrical Engineering Formulæ. By W. Geipel and H. M. Kilgour. Price 7s. 6d. nett, post free 7s. 9d.—Large paper edition, with wide margins, 12s. 6d., post free 13s.

The Art of Electrolytic Separation of Metals. By Dr. G. Gore, LL.D., F.R.S. Price 10s. 6d., post free.

Electro-Chemistry. By Dr. George Gore, LL.D., F.R.S. Second Edition. Price 2s., post free

Practical Notes for Electrical Students. By A. E. Kennelly and H. D. Wilkinson, M.I.E.E. Price 6s. 6d., post free

The Incandescent Lamp and its Manufacture. By Gilbert S. Ram. Price 7s. 6d., post free.

Drum Armature Winding and Commutators: In Theory and Practice. By F. Marten Weymouth. Price 7s. 6d., post free.

"The Electrician" Primers. In 2 vols., (consisting of 38 Primers in all). Vol. I., Theory; Vol. II., Practice. Price, each volume: Paper covers, 2s., post free, 2s. 2d.; cloth, 2s. 6d., post free, 2s. 9d. Or single Primers, 3d. each; post free, 3½d.

The Manufacture of Electric Light Carbons. A Practical Guide to the Establishment of a Carbon Manufactory. Price 1s. 6d., post free.

A Digest of the Law of Electric Lighting, and other Subjects. By A. C. Curtis-Hayward, B.A. Price 2s. 6d., post free.

Digitized by Google

The Steam-Engine Indicator and Indicator Diagrams. Edited by W. W. Beaumont, M.I.C.E., M.I.M.E., &c. Price 3s. 6d., post free

Electric Motive Power. By A. T. Snell. [*Nearly ready.*

Motive Power and Gearing. By E. Tremlett Carter. [*Nearly ready.*

Submarine Cable Laying and Repairing. By H. D. Wilkinson. [*In preparation.*

Practical Magnetism. By J. A. Kingdon. [*In preparation.*

[Postage of the above books abroad, 10 per cent. extra.]

For further particulars and list of works published by "THE ELECTRICIAN" PRINTING AND PUBLISHING COMPANY, LIMITED, *see pages 19—34. Prospectuses and catalogues post free on application.*

Electrical Plant and Electrical Industry (monthly), 52, Queen Victoria-st, London, E.C. Price 6d.

Electrical Review (weekly), 22, Paternoster-row, London, E.C. Price 4d.

"**ELECTRICITY**" (weekly), 29, Ludgate-hill, London, E.C. (Ann. sub., 5s.)

Electro-Hygiene (monthly), 1, West Harding-st, London, E.C. (Ann. sub., 3s. 6d.)

India Rubber, Gutta Percha and Electrical Trades' Journal (monthly), 28, Wilson-st, Finsbury, London, E.C. (Ann. sub., 15s.)

Journal of the Institution of Electrical Engineers (Messrs. E. & F. N. Spon, 125, Strand, London, W.C.)

"**LIGHTNING**" (weekly), 11, Queen Victoria-st, London, E.C. (Ann. sub., 10s. 6d.)

Telegraph Journal (twice monthly), Nelson-terrace, Philip-lane, Tottenham, London, N. (Price 2d.)

Partly Electrical.

British Trade Journal (monthly), 113, Cannon st, London, E.C.

Commerce (weekly, illustrated) Talbot House, Arundel-st, Strand, London, W.C. (Ann. sub., P.U., 28s.; single copies, 6d.)

Chemical News (weekly), Boy-ct, Ludgate-hill, London, E.C. Price 4d.

Chemical Trade Journal (weekly), 32, Blackfriars-st, Manchester. (Ann. sub., 12s. 6d.)

Engineer, The (weekly), 33, Norfolk-st, London, W.C. Price 6d.

Engineer and Iron Trades Advertiser (weekly), 28, Buchan-st, Glasgow. (Price 2d.)

Engineering (weekly), 35 and 36, Bedford-st, Strand, London, W.C. Price 6d.

Engineering and Mining Journal, of New York (weekly), 20, Bucklersbury, London, E.C. (Ann. sub., £1 8s. 9d.)

"**ENGINEERING MAGAZINE**" of New York (monthly). European Agency, 1, 2, and 3, Salisbury Court, Fleet-st, London, E.C. (Ann sub., post free, 12s. 6d.; abroad, 14s.)

Engineering Review (monthly), 29, Great George-st, London, S.W. (Ann. sub., P.U., 7s.)

English Mechanic and World of Science (weekly), 332, Strand, London, W.C. Price 2d.

Gas World (weekly), 3, Ludgate-circus-bldgs, London, E.C. Price 3d.

Gas Engineers' Magazine (monthly), 139, Moor-st, Birmingham. Price 6s. 6d. per annum

Illustrated Official Journal (Patents) (weekly), 38, Cursitor-st, Chancery-lane, London, W.C. Price £1. 15s. per annum

Industries and Iron (weekly), 17 and 18, Henrietta-st, Covent-garden, London, W.C. Price 6d.

Invention (weekly), 54, Fleet-st, London, E.C. Price 2d.

Iron and Coal Trades' Review (weekly), Outer Temple, 222-225, Strand, London, W.C. Price 6d.

Iron and Steel Trades' Journal and Mining Engineer (weekly), 84, Cannon-st, London, E.C. Price 6d.

Ironmonger, Universal Engineer and Metal Trades' Advertiser (weekly), 42, Cannon-st, London, E.C. Price 6d.

Ironmongers' Chronicle, 139 and 140, Fleet-st, London, E.C. (Ann. sub., 5s.)

Ironmongery (monthly), 148 and 149, Aldersgate-st, London, E.C. Price 3d.

Journal of the Society of Chemical Industry (monthly), 9, Bridge-st, Westminster, London, S.W. (Ann. sub., 30s.)

Journal of Gas Lighting (weekly), 11, Bolt-ct, Fleet-st, London, E.C. Price 6d.

Knowledge (monthly), 326, High Holborn, London, W.C. Price 6d.

Machinery: the Iron and Steel Trades Review (monthly), 50, Strand, London, W.C. (Price 8s. 6d. per annum)

Machinery Market and Exporter (monthly), 171, Queen Victoria-st, London, E.C. (Ann. sub., 5s.)

Mining Journal, Railway and Commercial Gazette (weekly), 18, Finch Lane, and 3, Dorset-bldgs, Salisbury-sq, London. E.C. (Price 6d.)

Nature (weekly), Bedford-st, Strand, London, W.C. Price 6d.

THE GENUINE

DODGE "STANDARD"

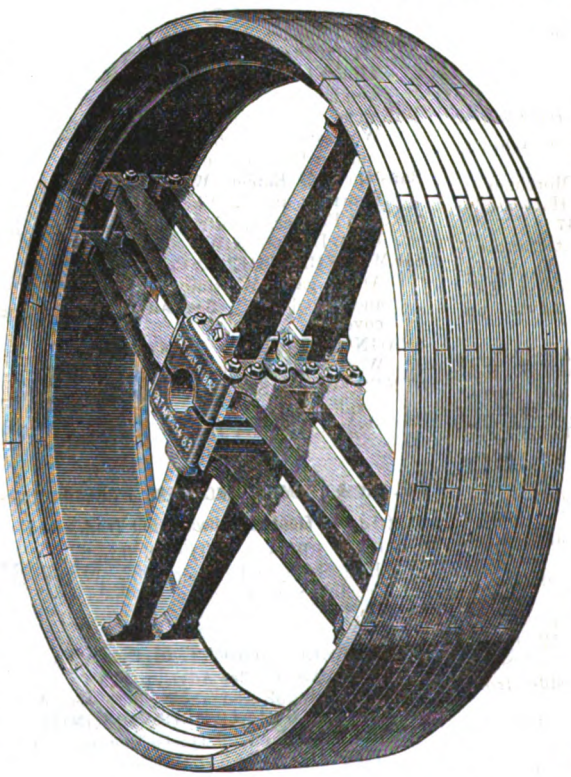
WOOD SPLIT PULLEYS

MANUFACTURED BY

THE DODGE WOOD SPLIT PULLEY COMPANY,

TORONTO (CANADA).

THE BEST FOR DRIVING DYNAMOS.



EVERY PULLEY A SPLIT PULLEY.

ADVANTAGES.

Every Pulley is a Split Pulley.

Every Pulley will transmit from 25 to 60 per cent. more power than iron, with same tension of belt.

They are 70 per cent. lighter than Iron Pulleys.

The fastening does not mar the Shaft.

Can be used on different sizes of Shafting.

They are in perfect balance.

They are the most thoroughly made Wood Pulleys in the World.

Are the Handsomest Pulleys on the Shaft ever made.

No Chances to take, every Pulley guaranteed as represented. Order a Sample Pulley, after which you will have no other.

All of our Wood Split Pulleys are sufficiently strong for the heaviest double leather belts made.

SOLE IMPORTERS:

BAGSHAWE BROS. & CO.,

4a, Upper Thames Street, LONDON, E.C.

Telegrams: "OUTBURST LONDON."

LARGE STOCKS IN MANY CENTRES. AGENTS WANTED.

Prize Medal International Inventions Exhibition, 1885. Silver Medal Crystal Palace Electrical Exhibition, 1892.

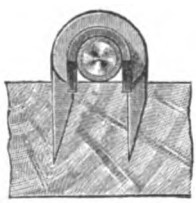
THE

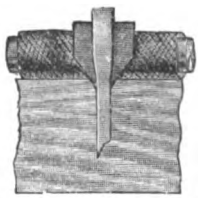
"INSULATING SADDLE STAPLE."

Patented February 4th, 1890.

No Driving Tool required.

Will drive equally well in hard or soft wood.





Possessing marked advantages over every form of staple or cleats heretofore used for

Electric Wiring.

The "Insulating Saddle Staples" supply a long-felt want for a SAFE STAPLE to be used in fastening electric light conductors and telephone and district messenger wires in mouldings, on timbers, back-boards and switch-boards; also telegraph wires in towers and offices; also burglar alarm annunciator, and all other low-pressure wires within the walls of buildings, especially in basements and places liable to moisture.

NEW "DIAMOND" DOUBLE-POLE SWITCHES
(LINK FORM).

This switch is built up of two ordinary New "Diamond" switches, mounted on the same base and actuated simultaneously by the same handle. The base of the switch is of enamelled slate, and is compounded of five separate portions, two of which carry the switches themselves, two others the terminal blocks, while on a fifth central slip is mounted the mechanism of the handle. These five slate slabs are secured to a strong wood back and are spaced apart by strips of ebonite, in order to ensure adequate insulation.

The switches are of our well-known multiple contact type, having an ample allowance of metal in all darts carrying current. On switching off, the break is effected instantaneously by means of four sets of springs, made of the best procurable steel. The cut-out blocks are constructed in such a manner that either the ordinary tin fuse wire or standard fuses may be employed.

The actuating mechanism consist of a powerful and strongly constructed link and lever action, which enables the making and breaking of the circuit to be effected without necessitating the application of any very considerable force. As mentioned above, the lever pivot is mounted upon a separate slate slab, and as the link pieces are of ebonite there is no possibility of the operator receiving a shock, even should the leakage of the circuit be considerable.

ANDERS' TELEPHONE CO., Ltd.

Offices: TELEPHONE BUILDINGS, 31, Queen Victoria Street, London, E.C.,

And at PARIS and BERLIN.

Works: No. 1, CLERKENWELL ROAD, LONDON, E.C.

TELEGRAPHIC ADDRESS: "REMEASURE, LONDON."

MANUFACTURERS OF TELEPHONES FOR ALL PURPOSES. LONDON MADE.

All our Microphones are provided with a new material (Anders' Patent) which is highly sensitive, and preserves its effectiveness under varying current and climatic changes, and the Telephones, being of the most simple construction and substantially made, they are not liable to get out of order.

Our instruments are louder than any hitherto placed on the market, and they are designed for Commercial and Domestic purposes as well as for Railroads and Steamships.

AN EXCELLENT GIFT BOOK.

"To the terminology of electricity what Johnson's Dictionary has been to the English tongue."

A DICTIONARY

OF

ELECTRICAL WORDS, TERMS, AND PHRASES.

BY

Prof. EDWIN J. HOUSTON, A.M.

THIS Dictionary has been entirely re-written and brought up to date, and contains the very newest words employed in the profession, as well as many whose rareness of use had consigned them to obscurity and oblivion.

Great care has been exercised to secure clearness, to the end that while the definitions and explanations shall be satisfactory to the expert electrician, they shall also be simple and intelligible to those who have had no training at all in electricity or are novices in the art.

The **Illustrations** have been specially prepared for the work, and add immensely to its usefulness. In some Sections, such as that on Types of Dynamos, or that on Armature Winding, where a clear understanding of the subject is slowly arrived at, they are profusely used, and the idea is graphically presented.

The Dictionary is a handsome book, neatly bound. The typography is neat and bold, and so arranged that each word catches the eye at once by standing out in bold relief. The binding and paper are first-class.

1, 2, and 3, Salisbury Court, Fleet Street, London, E.C.

COLONIAL GOVERNMENT ELECTRICAL DEPARTMENTS.

One of the principal drawbacks experienced in the endeavour to introduce new inventions, &c., to the notice of the heads of Government departments is the difficulty of selecting from the lists usually given the proper persons to be approached. With the object of rendering assistance, we have introduced the following authentic information for the benefit of patentees and manufacturers of instruments, apparatus, and plant who may desire to introduce electrical goods.

We are greatly indebted to the gentlemen who have so readily given us their assistance in procuring the particulars given.

BRITISH GUIANA.

POST AND TELEGRAPH DEPARTMENT.

Postmaster-General: F. W. Collins.
Consulting Electrician: W. H. Preece.
Chief Electrician: Samuel Vyle.
Assistant Electrician: Gilbert C. Vyle.

CANADA.

DEPARTMENT OF PUBLIC WORKS.

(The Government Telegraph Service is in this Department.)

Acting Superintendent: D. H. Keeley, Ottawa.

District Superintendents:—Hartley Gisborne, Qu'Appelle (North West Territory); Herbert Pope, South-West Point (Island of Anticosti); D. C. Dawson, St. John, N.B., Cape Breton (Nova Scotia); A. Le Bourdais, Grindstone Island (Magdalen Islands), E. Tètu, Pentecost, Q. (North Shore River and Gulf of St. Lawrence); J. Wilson, Vancouver (British Columbia); C. C. Seeley Grand Manan, N.B. (Bay of Fundy), Edwin Pope, Quebec (Quebec District).

CAPE COLONY.

POST AND TELEGRAPH DEPARTMENT.

Postmaster-General: S. R. French.
Superintendent of Telegraphs: B. Duff.

JAMAICA.

TELEGRAPH SERVICE.

Postmaster: Geo. W. Pearce.
Superintendent of Telegraphs: H. C. Wilson.
Consulting Electrician: W. H. Preece (London).
Director of Public Works: Hon. V. G. Bell.

NATAL.

POST AND TELEGRAPH DEPARTMENT.

Postmaster-General and General Manager of Telegraphs: J. Chadwick, J.P.
Engineering Inspector: T. T. Hardaker.

Digitized by Google

NEW SOUTH WALES.

POST AND TELEGRAPH DEPARTMENT.

Postmaster-General: Hon. J. Kidd.
Secretary of Telegraph Service: P. B. Walker.
Chief Electrician: J. Nelson. Assistant: A. A. Dircks.

NEW ZEALAND.

POSTAL AND RAILWAY TELEGRAPHS AND TELEPHONE SERVICES.

Head Superintendent: C. Lemon, Ph.D., M.I.E.E.
Electrician: W. C. Smythe, A.I.E.E.

QUEENSLAND.

POST AND TELEGRAPH DEPARTMENT.

Postmaster-General: W. A. Wilson.
Under-Secretary and Superintendent of Telegraphs: John McDonnell.
Chief Manager (Telegraph Branch): R. D. Bourne.
Acting Mechanician: S. H. Smith.

SOUTH AUSTRALIA.

TELEGRAPH AND TELEPHONE SERVICE.

Head Superintendent: Charles Todd, C.M.G., M.A., F.R.S.
Deputy Superintendent: E. Squire.
Chief Electrician and Fitter: C. Unbehaun.

RAILWAY SERVICE.

Chief Electrician: Thos. J. Dewhirst.

TASMANIA.

TELEGRAPH AND TELEPHONE SERVICE.

Superintendent of Telegraphs and Telephones and Chief Electrician:
Capt. Robert Henry.
Manager of Telegraphs: Frank P. Bowden (Hobart).
Managers of Telephones: Frank P. Bowden (Hobart); Frank Allison (Launceston).
P. T. Rutt (Zeehan).
Inspector of Lines: M. Faber.
Electrical Mechanician: Thomas Self (Hobart).

GOVERNMENT RAILWAY TELEGRAPHS.

Superintendent: John J. McDonald.

VICTORIA.

POST OFFICE AND TELEGRAPH DEPARTMENT.

Postmaster-General: Hon. Agar Wynne.
Deputy Postmaster-General and General Superintendent of Telegraphs:
James Smibert.
Chief Electrician, Telegraph Engineer, and Manager Telephone Exchange
Melbourne: George Smibert.
Chief Inspector: G. S. Caldwell.

WESTERN AUSTRALIA.

TELEGRAPH AND TELEPHONE SERVICE.

Superintendent: William J. Hancock, M.I.E.E., A.M.I.C.E.
Inspector of Telegraphs: F. A. Bailey, A.I.E.E.

INDIAN GOVERNMENT TELEGRAPH DEPARTMENT.

Director-General.—W. R. BROOKE, C.I.E.
Deputy Director-General.—J. H. LANE.
Director (Traffic Branch).—C. H. REYNOLDS.
Director (Construction Branch).—S. P. W. V. LUKE, C.I.E.

GENERAL ESTABLISHMENT.

Superintendents.

CLASS IV.

Bignell, W. K. D'O., Punjab.
Hill, T. C.
Melhuish, W. F., Calcutta.
Pitman, C. E., C.I.E., Check Office.

CLASS V.—1st GRADE.

Allen, J. J. (Electrician).
Bevan, J. F., Bombay.
Burke, J., Rajputana.
Charles, G. G., Sind and Baluchistan.
Hullah, A., Personal Assistant to the Director-General.
Kirk, H. A., Workshops.
Landon, C. P., Oude and Rohilkhand.
Larkins, A. B., Store Department.
Maclean, F. G., Calcutta.
O'Kelly, H. M.

CLASS V.—2nd GRADE.

Berrington, T. D., Malabar.
Brind, M. J.
Dempster, F. E., Burma.
Duffin, C., Dacca.
Gompertz, R. L. D., Arakan.
Hare, W. H. M., East Coast.
Hutchinson, S. H. C., Bombay Office.
Jones, W. C. N., Nagpur.
Leach, E. A., Indore.
Kinsman, F., Upper Burma.
Towers, G. L., Bellary.
Wheatley, G.

INDO-EUROPEAN TELEGRAPH DEPARTMENT.

LONDON OFFICE.

Director-in-Chief.—B. T. FFINCH.
Clerks.—C. E. J. Twisaday, C. W. Parratt, H. J. Andrews.

CONSTANTINOPLE OFFICE.

Agent.—T. J. Maltass.

PERSIAN GULF AND PERSIAN SECTIONS.

Director (Persian Gulf).—J. POSSMANN.
Director (Persian).—Lieut.-Col. H. L. WELLS, R.E., Teheran.
Assistant Director (Persian).—Major H. F. Chesney, R.E., Teheran.
Engineer and Electrician.—G. W. Sealy, Karachi.

Superintendents.

Allen, C. E., Karachi.
Fahie, J. J., Shiraz.
Harrison, H. B., Traffic Office.
Johnstone, T. Y.

Assistant Superintendents.

Barber, G., Persian Gulf.
Fargues, J., Teheran.
Graves, E., Ispahan.
Hawkins, J. P., Jask.
Navarra, W. S., Persia.
New, R. H., Bushire.
Smith, L. E. R., Store Department.
McMullen, B.
Medical Superintendent.—Dr. T. F. Odling. C.M.G., Teheran.
Assistant Medical Superintendent.—Dr. D. Scully, Shiraz.

"THE ELECTRICIAN"

ELECTRICAL TRADES' DIRECTORY.

COLONIAL DIVISION.

CLASSIFIED SECTION.

Particulars of Telegraphic Addresses and Telephonic Numbers of the Firms included in the CLASSIFIED SECTION *will be found in the* ALPHABETICAL SECTION *of the* DIRECTORY.

The Officials of Electrical Companies, where obtainable, are set out in the ALPHABETICAL SECTION.

ACCUMULATORS. (*See* **Batteries, Storage**).

AGENTS, MANUFACTURERS'.

Dey, Sil & Co, 20, Lall Bazar-st, Calcutta, India
Minnitt (John F.) & Co, Bombay
Pearson, E. W., 351-353, Little Flinders-st, Melbourne, Victoria
Selby, George William, 99, Queen-st, Melbourne, Victoria
WADIA (NOWROSJEE) & SONS, Tardeo, Bombay

ARC LAMPS, MAKERS OF.

Canadian General Electric Company, Toronto, Ont.; and at Montreal, &c.
Exact—Exact Arc Lamp Company, 88, Church-st, Toronto, Ont.
Royal Electric Company, 58-70, Wellington-st, Montreal, Canada
Russell—Craig-Russell Electric Company, Limited, 180, St. James-st, Montreal, Canada

ASSOCIATIONS (*see* **Societies**).

BATTERIES, STORACE, MAKERS OF.

Anglo-Canadian Electric Storage and Supply Company, Ottawa, Canada
Electric and Accumulator Company, 45, Queen-st East, Toronto, Canada
Roberts Storage Battery and Electric Construction Company, 46, Adelaide-st West, Toronto
Young, W. E., 1744, Notre Dame-st, Montreal

CARBON MAKERS AND DEALERS.

Ernest, Chas. F., New Hamburg, Ont.
Peterborough Carbon and Porcelain Company Peterborough, Ont., Canada

DYNAMOS, MAKERS OF.

Ball—Ball Electric Light Company, Limited, 70, Pearl-st, Toronto, Ont.
Brice (A. W.) & Co, 20, John-st North, Hamilton, Ont., Canada
Canadian General Electric Company, Toronto, Ont.; and at Montreal, &c.
Cone & Knight, Fergus, Ont., Canada
Kay Electric Works, 263, James-st North Hamilton, Ont., Canada
Langton (John) & Co, Canadian Life-bldg, Toronto, Ont.
Reliance Electric Manufacturing Company, Limited, Waterford, Ont.
Toronto Electric Motor Company, 107, Adelaide-st W., Toronto, Ont.

ELECTRIC BELLS AND ANNUNCIATORS, MAKERS OF.

Castle (J.) & Sons, 51, King-st, Newtown, Sydney, N.S.W.
Highland (Charles) & Co, 93, Market-st, Sydney, N.S.W.
Martin & Co, Jackson House, Calcutta; and 18, Esplanade-rd, Bombay
N.S.W. Master Plumbers, and Gasfitters' Co-operative Company, 379, Pitt-rd, Sydney, N.S.W.

LE PLUS ANCIEN ET LE MEILLEUR DES REVUES ANGLAISES D'ÉLECTRICITÉ.

Chaque Vendredi, Prix fr.0.40, par Poste fr.0.55.

THE ELECTRICIAN.

"THE ELECTRICIAN" a été fondé in 1853 sous une forme à peu près semblable à la publication actuelle, et après avoir occupé une des premières places parmi les journaux scientifiques de l'époque pendant environ trois années la publication en fut cessé.

De 1865 à 1878 la publication de "THE ELECTRICIAN" fut suspendue, aucun autre journal ou revue d'Electricité n'était d'ailleurs publié, et, comme il arrive souvent, la publication en fut reprise par un petit groupe, et spécialement consacré aux applications de l'Electricité à la télégraphie et téléphonie qui étaient à cette époque la principale industrie électrique, et cette fois encore il fut reconnu comme le meilleur organe technique consacré aux Sciences Electriques et à l'Industrie. On voit donc par ce qui précède qui "THE ELECTRICIAN" est le plus ancien des revues anglaises d'Electricité. Depuis cette époque la publication de "THE ELECTRICIAN" s'est continuée sans interruption et a fait de rapides progrès principalement depuis 1887, et a toujours été consideré comme le plus intéressant, le mieux informé, le plus complet et le meilleur marché des revues anglaises d'Electricité, par ses nombreux articles et illustrations sur les nouvelles découvertes scientifiques, indiquant les moyens de les exploiter d'une façon commerciale et avec profits. On trouvera dans les volumes de "THE ELECTRICIAN" une collection d'articles du plus haut intérêt spécialements écrits par :—

Ainsi que tous les mémoires lus devant les principales Institutions, Sociétés savantes et Académies du monde entier, avec les discussions qui ont été faites.

Indépendamment de ce qui précède "THE ELECTRICIAN" a attaché une grande importance et souvent consacré plusieurs pages à la section légale et aux procès relatifs a l'Electricité durant ces 14 dernières années, ce qui lui a donné une certaine autorité en justice et lui a valu maintes consultations de la part des sommités juridiques. Il suffit de rappeler les procès qui ont eu lieu au sujet de brevets Edison-Swan, de l'enroulement compound, de l'emploi des hautes et basses tensions, des accumulateurs, des téléphones, etc., etc., dans desquels "THE ELECTRICIAN" a figuré comme autorité et accepté par les parties adverses.

"THE ELECTRICIAN" donne chaque semaine avec une regularité parfaite et exacte les comptes-rendus des réunions des Compagnies, Sociétés exploitant une branche quelconque de l'Industrie Electrique, ainsi que les informations financières qui était donné le caractère de "THE ELECTRICIAN" et sa complète indépendance de toute opération financière en font un journal de premier ordre pour ce genre de renseignements et permit aux souscripteurs de posséder chaque vendredi matin les comptes-rendus complets de toutes réunions tenues jusqu'à jeudi soir.

Les articles publiés dans "THE ELECTRICIAN" sont absolument inédits et écrits spécialement par des personnes qui n'ont aucun intérêt pour un système particulier, complètement indépendant et n'ayant qu'un but, celui de l'avancement des sciences électriques. Beaucoup de ces articles originaux ont été revisés par leurs auteurs et publiés sous forme de livre, formant la **Serie de "The Electrician"** et dont une liste complète se trouve sur pp. 24-27.

Les lecteurs de "THE ELECTRICIAN" appartiennent à toutes les classes de l'Electricité et sont répandus dans l'univers entier, ce qui explique la grande circulation de ce journal. Les volumes finissent en Mai et en Novembre, et forme des revues d'un plus grand intérêt et les plus complètes sur l'Electricité et ses applications publiées dans le monde entier.

Enfin, les immenses services rendus par "THE ELECTRICIAN" autant pour les études techniques que pour les études générales sur l'Electricité, son caractère absolument scientifique, banissant la réclame commerciale de ses colonnes, en font actuellement un journal de premier ordre et le classes comme le meilleur des tous les journaux et revues d'Electricité.

CONDITIONS DE SOUSCRIPTION:

	Un An.		Six Mois.		Trois Mois.
Grande Bretagne	**fr.25**	.....	**fr.13**	.....	**fr.6.75**

FOREIGN GOVERNMENTS' ELECTRICAL DEPARTMENTS.

One of the principal drawbacks experienced in the endeavour to introduce new inventions, &c., to the notice of the heads of Government departments is the difficulty of selecting from the lists usually given the proper persons to be approached. With the object of rendering assistance, we have introduced the following authentic information for the benefit of patentees and manufacturers of instruments, apparatus, and plant who may desire to introduce electrical goods.

We are greatly indebted to the gentlemen who have so readily given us their assistance in procuring the particulars given.

AUSTRIA.

MINISTRY OF COMMERCE.

(The Post and Telegraph Department is a part of this Ministry.)
Minister of Commerce: His Excellency Gundacker Comte Wurmbrand.
Chief of the "Praesidial Bureau": Section Chief Dr. Ernest von Körber.

POST AND TELEGRAPH DEPARTMENT.

Chief: Johann Ritter von Obentraut (Director-General of Posts and Telegraphs).

Assistants.

Ministerial Councillors: Dr. Adalbert Hofmann; Dr. Alfred Freiherr von Lilienau; Josef von An der Lan; Adolph Koch von Langentren.
Section Councillors: Dr. Anton Ritter von Ostenhof; Dr. Rudolph Neubauer; Theodor Habberger; Dr. Carl Benesch; Dr. Friedrich Szabo.
Ministerial Secretaries: Dr. Eduard Urbantschitsch; Dr. Mansuet Kosel; Dr. Ernst Gollner.

TELEGRAPH TECHNICAL DEPARTMENT.

Court Councillor: Dr. Franz Steiner (Chief Electrician).
Chief Councillor: Georg Höfert; Alois Rieber.
Councillors: Josef Kareis; Franz Schmid.

BAVARIA.

DIRECTION OF POSTS AND TELEGRAPHS.

Director-General: Adolph Ritter von Schamberger.
Councillors: Eduard Seifert, Lorenz Ringer and August Stähler.
Engineers: Gottfried Mirus and Emil Bieringer.

BELGIUM.

MINISTÈRE DES CHEMINS DE FER, POSTES ET TÉLÉGRAPHES.

Ministre: J. Vandenpeereboom.

ADMINISTRATION DES TÉLÉGRAPHES.

Direction Générale.

Directeur-Général: F. H. Delarge.

Direction Technique.

Directeur d'Administration: P. J. Banneux, Ingénieur en Chef.

Direction Administrative.

Directeur d'Administration: Ph. H. Schruers.

BULGARIA.

DIRECTION-GÉNÉRALE DES POSTES ET TÉLÉGRAPHES.

Director-General: J. Michailoff.
Inspector: T. Minkoff.
Electrician: P. Sebichan.

Digitized by Google

CHINA.

TELEGRAPH DEPARTMENT.

Director: Sheng Chang Wye.
Sub-Director: Shun In Shuen.
Traffic Manager: O. Möller.
Chief Engineer: Chr. Jensen Yunnan.

DENMARK.

TELEGRAPH SERVICE.

Director: Lieut.-Col. H. Hoencke.
Chief Electrician and Engineer: V. Lorentzen.
Engineer: C. V. E. Gredsted.

RAILWAY SERVICE.

Director-General: J. V. Tegner.
Chief Engineers: Lieut.-Col. H. A. R. Elben and W. M. Friderica.
Telegraph Engineers: O. R. V. Thrane and N. R. Meyer.

EGYPT.

ADMINISTRATION DES CHEMINS DE FER, DES TÉLÉGRAPHES ET DU PORT D'ALEXANDRIA.

Halton Pasha (President), M. Prompt and Boghos Pasha Nubar (Directors).
Traffic Manager: Scander Bey Fahmy.
Engineer-in-Chief: Nicour Bey.
Inspector-General of Telegraphs: E. A. Floyer.
Controller-General of Port: Morice Pasha.

FRANCE.

DIRECTION-GÉNÉRALE DES POSTES ET DES TÉLÉGRAPHES.
Directeur-Général: M. de Selves.

DIRECTION DU MATÉRIEL ET DE L'EXPLOITATION ÉLECTRIQUE.
Directeur: M. Raymond.
Chefs du Bureau: MM. Vasbender, Seligman, Thévanin, Vasseur, Encoffon.

DIRECTION DE L'EXPLOITATION POSTALE.
Directeur: M. Ansault.
Chefs du Bureau: MM. Bax, Corneille, Rolland, Blanquet, Léglise.

DIRECTION DE LA COMPTABILITÉ.
Directeur: M. Vannaque.
Chefs du Bureau: MM. Bourdon de Launay, de Baudel, Rambaud.

DIRECTION DE LA CAISSE D'EPARGNE.
Directeur: M. de la Boulaye.
Chefs du Bureau: MM. Croze-Fourton, Goudchaux, Duparcq.

DIRECTION TECHNIQUE DE LA RÉGION DE PARIS.
Directeur: M. Amiot.

DIRECTION DES POSTES ET DES TÉLÉGRAPHES DE LA SEINE.
Directeur: M. de Marguerittes.

ÉCOLE PROFESSIONNELLE SUPÉRIEURE.
Directeur: M. Lorin.

VÉRIFICATION ET RÉCEPTION DU MATÉRIEL.
Chef du Service: M. Clérac.
Chef du Service des Ateliers: M. Bigot de la Touanne.

GERMANY.

REICHS-POSTAMT.

Staatssekretair: Dr. H. von Stephan.
Direktoren: Herren Dr. Fischer, Sachse, and Scheffler.
Ober-Telegraphen-Ingenieure: Dr. Strecker and Postrath Harrass.

GREECE.

MINISTRY OF THE INTERIOR.

(The Post and Telegraph Department is a part of this Ministry.)
Minister of the Interior: M. Bonfides.

DIRECTION-GENERAL OF POSTS AND TELEGRAPHS.

Director-General: M. Demosthenes Avantinos.
Director of Telegraph Department: M. C. Maroudis.
Secretary: M. O. Stanghel.

HOLLAND.

MINISTRY OF WATERSTAAT, COMMERCE AND INDUSTRY.

(The Post and Telegraph Department is a part of this Ministry.)
Minister: His Excellency C. Lely.

POSTS AND TELEGRAPH DEPARTMENT.

Chief: J. P. Hofstede (Director-General of Posts and Telegraphs).

POST OFFICE.

Inspectors in General Service: J. J. Doffegnies and C. van der Veen.

TELEGRAPH OFFICE.

Inspector-in-Chief for General Traffic: A. H. van Thiel.
Engineer-in-Chief for Technical Service: J. M. Collette.
Inspector in General Service: A. Kruyt.

HUNGARY.

MINISTRY OF COMMERCE.

(The Post and Telegraph Department is a part of this Ministry.)
Minister of Commerce: His Excellency Béla Lukács.
State Secretary: Eduard Reissig.

POST AND TELEGRAPH DEPARTMENT.

Chief Ministerial Councillor: Peter Heim.

Assistants.

Paul Sebes, Chief of the Personal Sub-Division.
Zsigmond Schrimpf, Chief of the International Sub-Division.
Béla Szabó, Chief of the Postal Sub-Division.
Vince Nádor, Chief of the Bureau des cours Postals.

TELEGRAPH TECHNICAL SUB-DIVISION.

Chief: Colomannus Pfannschmiedt. Assistant: Joseph Kiss.

ITALY.

MINISTRY OF POSTS AND TELEGRAPHS.

Minister: S. E. Comm. M. Ferraris, Deputato al Parlamento Nazionale.
Secretary of State: Prof. Louis Rava, Deputato al Parlamento Nazionale.

TELEGRAPH SERVICE.

Inspector-General: Commendatore Ernesto Ponzio Vaglia.
Director Head Division: Cavaliere Federico Eula.
Departmental Directors: Commendatore Tommaso Picco, Cavaliere Francesco Civalleri, Cavaliere Onorato Maladorno, Cavaliere Giuseppe Piloni, and Cavaliere Ogier Enrico.

DIE ÄLTESTE UND BESTE ENGLISCHE ELEKTROTECHNISCHE WOCHENSCHRIFT.

ERSCHEINT JEDEN FREITAG, PREIS 4d., PORTOFREI, 4½d.

THE ELECTRICIAN.

"THE ELECTRICIAN" wurde ursprünglich im Jahre 1863 gegründet, in einer Form, welche der heutigen Ausgabe ähnlich war. Nachdem diese Zeitschrift während etwa drei Jahren eine hervorragende Stellung unter den wissenschaftlichen Zeitschriften eingenommen hatte, wurde sie wieder aufgegeben, nicht ohne dass sie gezeigt hatte, dass eine solche Zeitschrift eine bedeutende Stellung unter den wissenschaftlichen und technischen Zeitschriften einzunehmen im Stande war.

In der Zeit von 1865 bis 1878 wurde "THE ELECTRICIAN" allseitig vermisst, da keine Wochenschrift welche sich mit den Interessen der Elektrotechnik befasste, vorhanden war; und so wurde der "ELECTRICIAN" von einigen Persönlichkeiten, welche ein bedeutendes Interesse an der Telegraphentechnik, dem damaligen Hauptindustriezweige der Elektrotechnik hatten, wieder von neuem ins Leben gerufen, und als das leitende Organ der elektrotechnischen Wissenschaft und Industrie begründet. "THE ELECTRICIAN" ist sonach das älteste elektrotechnische Fachblatt. Seit seiner zweiten Begründung, namentlich aber seit dem Jahre 1887 machte "THE ELECTRICIAN" rasche Fortschritte, und brachte stets in eingehender und umfassender Weise alle grossen Entdeckungen und Untersuchungen der elektrotechnischen Wissenschaft und deren praktische Verwendung zur Kenntniss seiner Leser. Die Jahrgänge des "ELECTRICIAN" sind eine wertvolle Sammlung von Original Aufsätzen und von Artikeln von beinahe allen hervorragenden elektrotechnischen Schriftstellern. Als Mitarbeiter seien unter Anderen die folgenden genannt:

Prof. W. G. Adams,
Mr. G. L. Addenbrooke,
Sir James Anderson,
Mr. L. B. Atkinson,
Prof. W. E. Ayrton,
Prof. W. F. Barrett,
Mr. Shelford Bidwell,
Mr. T. H. Blakesley,
Mr. C. Vernon Boys,
Major P. Cardew,
Mr. E. T. Carter,
Mr. R. E. Crompton,
Prof. W. Crookes,
Prof. J. Dewar,
Mr. W. B. Esson,
Mr. Sydney Evershed,
Prof. J. A. Ewing,
Mr. C. A. Faure,
Mr. Desmond G. FitzGerald,
Dr. J. A. Fleming,
Prof. George Forbes,
Prof. W. Garnett,
Mr. W. Geipel,
Dr. Gladstone,
Prof. R. T. Glazebrook,
Dr. George Gore,
Mr. Oliver Heaviside,
Prof. von Helmholtz,
Dr. H. Hertz,
Mr. Paget Higgs,
Dr. Edward Hopkinson,
Dr. John Hopkinson,
Prof. E. J. Houston,
Prof. D. E. Hughes,
Mr. Gisbert Kapp,
Prof. A. B. W. Kennedy,
Mr. A. E. Kennelly,
Dr. Oliver Lodge,
Prof. J. Clerk Maxwell,
Prof. Mengarini,
Mr. W. M. Mordey,
Dr. Alex. Muirhead,
Prof. John Perry,
Mr. W. H. Preece,
Mr. J. S. Raworth,
Lord Rayleigh,
Prof. Rowland,
Prof. Rucker,
Mr. Warren de la Rue,
Sir David Salomons,
Dr. Paul Schoop,
Mr. Louis Schwendler,
Mr. G. F. C. Searle,
Mr. J. S. Sellon,
Mr. Alex. Siemens,
Dr. Werner Siemens,
Mr. M. Holroyd Smith,
Mr. Willoughby Smith,
Mr. Albion T. Snell,
Mr. W. H. Snell,
Dr. W. Spottiswoode.
Mr. J. T. Sprague,
Prof. Balfour Stewart,
Dr. W. E. Sumpner,
Mr. James Swinburne,
Mr. Nikola Tesla,
Mr. H. Tomlinson,
Prof. Silvanus Thompson,
Mr. Elihu Thomson,
Sir Wm. Thomson (Lord Kelvin),
Prof. J. J. Thomson,
Mr. A. P. Trotter,
Mr. G. W. de Tunzelmann,
Prof. John Tyndall,
Mr. F. C. Webb,
Mr. F. M. Weymouth,
Mr. H. D. Wilkinson,
Dr. Zetzsche,
u. s. w., u. s. w.

Auch alle Vorträge welche von hervorragenden Männern in den bedeutensten technischen Gesellschaften der Welt gehalten wurden, sowie die Diskussionen darüber sind im "ELECTRICIAN" zu finden.

Nicht minder bietet der "ELECTRICIAN" eine vollständige Sammlung aller juristischen Untersuchungen, welche die Gerichtshöfe in den letzten 14 Jahren beschäftigten, und "THE ELECTRICIAN" geniesst bei den Gerichtshöfen in allen elektrotechnischen Fragen ein hervorragendes authoritatives Ansehen. In dieser Beziehung, sie nur auf die Akten über die Edison- und Swan-Patente, die Kompound Wickelung-Patente, die Hoch- und Nieder-Spannungs Systeme, die Akkumulatoren-Patente, die Telephon-Patente, u. s. w., verwiesen, in welchen "THE ELECTRICIAN" als eine Authorität angezogen und von den Parteien anerkannt wurde.

Eine stehende Rubrik des "ELECTRICIAN" bilden die wortgetreuen Berichte über die Sitzungen der elektrischen Gesellschaften und Korporationen, und während "THE ELECTRICIAN" niemals die Gebiete, deren Bearbeitung den finanziellen Blättern allein gebührt, berührt hat, so bietet er andererseits allwöchentlich zuverlässige, ausführliche und vollkommen unabhängige finanzielle Berichte. Finanziellen Interessen irgend welcher Art steht er fern und sucht seine ausschliessliche Aufgabe in der Förderung der Interessen des Fachs, welchem zu dienen er berufen ist. "THE ELECTRICIAN" bringt Berichte über Versammlungen u. s. w. bis einschliesslich Donnerstags, so dass die Interessenten ihre Nummer durch die Freitag-Morgen-Post erhalten.

Die Original-Artikel des "ELECTRICIAN" werden von Männern verfasst, welche keinerlei persönliches Interesse an elektrischen Systemen haben, und deren Aufgabe lediglich in der allgemeinen Forderung der elektrotechnischen Wissenschaft und Industrie besteht. Viele dieser Original-Artikel sind inzwischen von ihren Verfassern in Buchform umgearbeitet und herausgegeben worden. Dieselben bilden den Kern der "**Electrician Series**," über welche umstehend Näheres zu finden ist.

Zählt "THE ELECTRICIAN" zu seinen Mitarbeitern die angesehensten Denker und Praktiker unserer Zeit, so finden sich seine Leser in allen Theilen der Welt, und keine englische Zeitschrift seiner Art besitzt eine so grosse Kundschaft als "THE ELECTRICIAN." Die Bände werden im Mai und November abgeschlossen, und bilden den vollständigsten Bericht über die elektrotechnische Wissenschaft und Praxis, welcher in irgend einer Sprache gefunden werden kann.

Auch für die technische Fortbildung ist "THE ELECTRICIAN" von unschätzbarem Nutzen, und hat viel zu der heutigen grossen Verbreitung elektrotechnischer Kentnisse beigetragen. Wer in der Elektrotechnik nach Ehre und Ruhm strebt, kann mit dem nimmer rastenden Laufe der Erfindungen, welche jeder Tag der Elektrotechnik bringt gleichen Schritt nicht halten ohne das fortwährende eingehende Studium der Spalten des hervorragendsten elektrotechnischen Blattes, des "ELECTRICIAN."

ABONNEMENTSPREIS:

	Pro Jahr.	Pro Semester.	Pro Quartal.
England	**M.20**	**M.10.50**	**M5.25**
Weltpostverein	**25**	**13**	**6.75**
Andere Länder	**28·75**	**15**	**7.75**

Die bedeutende Verbreitung des "ELECTRICIAN," welche alle anderen Englischen Fachblatter weit übertrifft, dabei sein mässiger Preis, machen denselben zum

BESTEN BLATTE FÜR ANNONCEN.

Zu beziehen von

"THE ELECTRICIAN" PRINTING AND PUBLISHING COMPANY, LIMITED,
SALISBURY COURT, FLEET STREET, LONDON, E.C., ENGLAND.
Und von allen Buchhandlungen.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.

12, WEST THIRTY-FIRST-STREET, NEW YORK.

In 1884 the American Institute of Electrical Engineers was organised in New York City, with the following purpose, as stated in the rules:—

"The objects of the American Institute of Electrical Engineers are to promote the Arts and Sciences connected with the production and utilization of Electricity, and the welfare of those employed in these industries; by means of meetings for social intercourse, the reading and discussion of professional papers, and the circulation, by means of publications among its Members and Associates, of the information thus obtained."

On November 1st, 1893, there were 2 Honorary Members, 211 Members, and 528 Associate-Members—a total membership of 741.

OFFICERS AND MEMBERS OF THE COUNCIL—1893-94.

President.

Prof. EDWIN J. HOUSTON.

Past Presidents.

Dr. Norvin Green, 1884-5-6.
Franklin L. Pope, 1886-7.
T. Commerford Martin, 1887-8.
Edward Weston, 1888-9.
Prof. Elihu Thomson, 1889-90.
Prof. W. A. Anthony, 1890-91.
Alexander Graham Bell, 1891-92.
Frank J. Sprague, 1892-93.

Vice-Presidents.

A. E. Kennelly.
Nikola Tesla.
O. T. Crosby.
Patrick B. Delany.
H. Ward Leonard.
William Wallace.

Managers.

Dr. Louis Bell.
Herbert Laws Webb.
Prof. A. G. Compton.
James Hamblet.
Charles Wirt.
Angus S. Hibbard.
Dr. Michael I. Pupin.
Chas. P. Steinmetz.
Prof. Harris J. Ryan.
Charles Hewitt.
J. J. Carty.
William J. Hammer.

Treasurer.

Geo. M. Phelps, 203, Broadway, New York.

Secretary.

Ralph W. Pope, 12, West Thirty-first-street, New York.

Board of Examiners.

W. B. Vansize, Chairman.
George A. Hamilton, C. O. Mailloux, E. T. Birdsall, Edward P. Thompson.

"THE ELECTRICIAN"
ELECTRICAL TRADES' DIRECTORY.

AMERICAN DIVISION.

ALPHABETICAL SECTION.

NOTES.—*Telegraphic and Cable Addresses and Telephone Numbers are shown in italics. In order to render* "THE ELECTRICIAN" ELECTRICAL TRADES' DIRECTORY AND HANDBOOK *as complete and serviceable as possible, the Editors will be glad to receive during 1894 Changes of Address, Names and Addresses not included in the present Edition, newly-registered Telegraphic and Cable Addresses and Telephone Numbers.* No charge is made for inserting these particulars.

An asterisk (*) *prefixed to a name indicates that a* BIOGRAPHICAL SKETCH *appears at the end of the book.*

Advertisers *in* THE DIRECTORY *will find* **prominent reference** *made to their Advertisements and to the pages in which they occur.*

Cornish, James T., Electrical Engineer, and Contractor and Engineer to the Companhia Luz Electrica, São Carlos de Pinhal, Estado de São Paulo, Brazil

Cory, Clarence L., Consulting Electrician and Professor of Electrical Engineering, University of California, Berkeley, Cal.

Costillo, J. E., Manufacturing Electrician, Cor. Hudson-avenue and Concord-street, Brooklyn, N.Y.

Courter, Albert C., Maker of the Crown Dynamo, 209, Market-st., Newark, N.J.

Courtis & Smith, Electricians, Metallurgists and Assayers, 27, Larned-street West, Detroit, Mich.

Cowles, Alfred H., Electrical Engineer, Technical Adviser to the Cowles Electric Smelting and Aluminium Company, 656, Prospect-street, Cleveland, O.

Cowles Electric Smelting and Aluminum Company, Producers of Aluminum and Silicon Bronze, Lockport, N.Y. (*Cowles New York*)

Cowles, Joseph W., Electrical Engineer, General Electric Company, 620, Atlantic-ave., Boston, Mass.

Cox, Ernest Spencer, Electrical Engineer, c/o Messrs. Burlamacchi-Vinci y Cia, Calle Rivadavia 283, San Juan, Argentine Republic

Craig, J. Hally, Consulting Electrical Engineer, John Hancock-bldg, 178, Devonshire-st., Boston, Mass.

Craighead, H., Electrical Engineer, Westinghouse Electric Co, Pittsburg, Pa.

Cramp & Co., General Engineers and Turbine Makers, Philadelphia, Pa.

Crandell Manufacturing Company, Manufacturers of Electrical Specialities, 66, N. 4th-street, Philadelphia, Pa.

Crane Elevator Company, Makers of Electric Elevators, Chicago, Ill.

Crane, F. N., Electrical Engineer, 179, Market-st, Newark, N.J.

CRANE, W. F. D., M.E., E.E., Electrical and Mechanical Engineer, Manager of the Electrical Department, H. W. Johns Manufacturing Company, 87, Maiden-lane, New York

Craven (S. Norris) & Co., Limited, Makers of Electric Elevators, 515, Mulberry-street, Philadelphia, Pa. (*1628*).

Creaghead Engineering Company, Electrical Engineers and Dealers in Electrical Supplies, 296, Plum-street, Cincinnati, O. (Thos. J. Creagshead, Manager)

Crehore, Dr. Albert C., Electrician, Assistant Profrssor of Physics, Dartmouth College, Hanover, N.J.

Cresson (Geo. V.) & Co., Electrical Engineers Cor. 18th and Alleghany-ave., Philadelphia, Pa.

Crocker-Wheeler Electric Company, Electrical Engineers and Makers of Electric Motors, Taylor-bldg., 39 and 41, Cortlandt-st, New York. Works: Ampère, East Orange, Newark, N.J. (*Crockwheel New York.*)

*Crocker, Francis B., Professor of Electrical Engineering, Columbia College, New York

Crodus Electric Company, Manufacturing Electrical Engineers, Milwaukee, Wis.

Crosby Electric Company, Manufacturers of Electrical Apparatus, 110, Fifth-avenue, and 121, South Fifth-avenue, New York

*Crosby, Oscar T., Electrical Engineer, General Manager Railway Department, General Electric Company, 44, Broad-st, New York

Cross, A. Murray, Telegraph, Engineer, Empresa del Telegrapho Submarino, Valparaiso, Chili

Cross, Prof. C. R., Thayer Professor of Physics and Director of the Rogers Laboratory, Massachusetts Institute of Technology, Boston, Mass.

Cross, John A., Consulting Electrical Engineer, Central Lighting Station, Geneva, N.Y.

Crouch Electric Supply Company, Manufacturers of Electrical Supplies, Portland, Ore.

Crouse-Tremaine Carbon Company, Electric Light Carbon Manufacturers, Fostoria, O.

Crowdus Chemical Electric Company, Manufacturers of the "Crowdus" Multipolar Cell Battery, Memphis, Tenn.

Crown Electric Manufacturing Company, Manufacturers of Electrical Apparatus, Bridgeport, Conn.; and at 18, Cortlandt-st, New York

Culbertson, Dr. J. N., Electrical and Telephone, Engineer, Bell Telephone Company, 14 W. Seneca Main-st, Buffalo, N. Y.

Cummings and Engleman Conduit Company, Makers of Electric Light Wire Conduits, Telephone-bldg, Detroit, Mich

Cummins, E. C., Electrician, Western and Brazilian Telegraph Company's s.s. "Norseman," Pernambuco, Brazil

Cumner, Craig & Co, Consulting Electrical Engineers, John Hancock-bldg, 178, Devonshire-st, Boston, Mass.

Cumner, Arthur B., Cumner, Craig & Co, John Hancock-bldg, 178, Devonshire-st, Boston, Mass.

Cunha, Manuel Ignacio de, Manager of the Electrical Section, Empreza Industrial Gram-Para, Para, United States of Brazil

Cuntz, Johannes H., Electrician, 325, Hudson-st, Hoboken, N.J. *Cuntz Hoboken*

Currie, Stanley, B.A., Electrical Expert, Drexel-bldg, Philadelphia, Pa.

Curtis, Charles G., Electrical Engineer and President, Curtis Electric Manufacturing Co, Pacific-av, Jersey City, N.J.

Curtis Electric Manufacturing Company, Makers of Electric Railway Machinery, Pacific-av, Jersey City, N.J.

Curtiss, Geo. F., Electrical Engineer, General Electric Company, 180, Summer-st, Boston, Mass.

Cushing Electric Co, Electrical Engineers, Boston, Mass.

Cushing & Morse, General Western Agents for Day's Kerite, 225, Dearborn-st, Chicago, Ill.

Cushman, Abe L., Electrcian and Chemist, Granite State Electric Company, 31, South Main-st, Concord, N.H.

Cushman, Holbrook, Electrical Engineer, 337, West Twenty-second-st, New York

"THE ELECTRICIAN"

ELECTRICAL TRADES' DIRECTORY.

AMERICAN DIVISION.

CLASSIFIED SECTION.

Particulars of Telegraphic Addresses and Telephone Numbers of the Firms included in the CLASSIFIED SECTION *will be found in the* ALPHABETICAL SECTION *of the* DIRECTORY.

The Officials of Electrical Companies, where obtainable, are set out in the ALPHABETICAL SECTION.

AGENTS, MANUFACTURERS'.

Askew & Russell, P.O. Box, 326, Chicago, Ill.
DIAGO, FREDERIC C., 30, Oficios-st, P.O. Box 278, Havana, Cuba. **See Advt., p. 496**
Nery da Fonseca, L., P.O. Box, 202, and 60, Rua Marquez de Olinda, Pernambuco
SHAIN, CHAS. D., 136, Liberty-st, New York

AMERICAN MACHINERY AGENTS.

DIAGO, FREDERIC C., 30, Oficios-st, P.O. Box, 278, Havana, Cuba. **See Advt., p. 496**

AMMETERS, MAKERS OF.

Brush Electric Company, Belden-st, Cleveland, O.
Electro-Dynamic Company, 224, Chestnut-st, Philadelphia, Pa.
General Electric Company, 620, Atlantic-avenue, Boston, Mass.; and Broad-st, New York
Queen & Co. (Incorporated), 924, Chestnut-st, Philadelphia, Pa.
Walker—Vail, W. A., 136, Liberty-st, New York
Weston Electrical Instrument Co, 114-120, Williams-st, Newark, N.J.
White House Mills, Hoosick, N.Y.

ARC LAMPS, MAKERS OF.

Acme—Schefbauer & Co, 28 and 32, Centre-st, New York
American—New American Electrical Arc Light Company, 2, Cortlandt-st, New York
Atwood—Atwood (A. H.) Electric and Manufacturing Company, 166-174, S. Clinton-st, Chicago, Ill.; and St. Louis, Mo.
Baby—Russell Electric Lamp Company, Portland, Me.
Ball—Ball Electric Light Company, 404, West Twenty-seventh-st, New York
Band—Siemens & Halske Electric Company, Monadnock-bldg, Chicago, Ill.
Brush—Brush Electric Company, Belden-st, near Mason-st, Cleveland, Ohio
Clark—Clark Electric Company, Corbin-bldg, 192, Broadway, New York
Cohen—National Electric Light and Power Company, Bullitt-bldg, Philadelphia, Pa.
Cowling—Powellton Electric Company, 108, S. 40th-st, Philadelphia, Pa.
Duplex—Duplex Electric Company, Limited, Corry, Pa.
Easton—Easton Electric Company, 643, Kent-avenue, Brooklyn, N.Y.
Excelsior—Excelsior Electric Company, 44, Broad-st, New York; and 425, The Rookery, Chicago, Ill.
General Incandescent Arc Lamp Company, 572-576, First-avenue, New York
Graves—Graves (W. D.) Electrical and Machine Works, Cleveland, O.

Weston—United States Electric Lighting Company (Westinghouse Electric Company), 120, Broadway, New York
Wirsching (A.) & Sons, 28-32, Centre-st, New York

ASSOCIATIONS (*see* **Societies**).

BATTERIES, DRY, MAKERS OF.

Atlas—Hood (Wm.) & Co, 239, La Salle-st, Chicago, Ill.
Champion—Hirlimann, C. J., 117, Macdougal-st, New York
Chloride of Silver Dry Cell Battery Company, Baltimore, Md.
Crowdus—Electric Fare Box Company, 418, Cedar-st, Nashville, Tenn.
Diaphragm—Nowotny Electric Company, 30, East Fifth-st, Cincinnati, Ohio
Exeter—Greeley (E. S.) Company, 5 and 7, Dey-st, New York
Himmer & Anderson, 123, Chambers-st, New York
Imperial—Miamisburg Electric Company, Miamisburg, O.
Jupiter—Columbia Manufacturing and Supply Company, 340-342, Dearborn-st, Chicago, Ill.
Mesco—Manhattan Electrical Supply Company, 36, Cortland-st, New York
Meteor—Tod-Applegate Company, 340 and 342, Dearborn-st, Chicago, Ill.
Nassau—Nassau Electrical Company, 112, White-st, New York
Phonix—Western Electric Company, 227, S. Clinton-st, Chicago, Ill.
Standard—Bunnell (J. H.) and Company, 76, Cortlandt-st, New York

BATTERIES, GALVANIC, MAKERS OF.

Bryan, Marsh & Co, 136, Liberty-st, New York
McIntosh Battery and Optical Company, 141, Wabash-avenue, Chicago, Ill.
National Galvanic Battery Company, 13, Cortlandt-st, New York
Otto (F. G.) and Sons, 44-50, Sherman-avenue, Jersey City, N.J.
Perfect—Galvano-Faradic Manufacturing Company, 300, Fourth-avenue, New York

BATTERIES, PRIMARY, MAKERS OF.

Burnley—Miamisburg Electric Company, Miamisburg, O.
Cornell—Pheneger Chemical Company, Columbus, O.
Crescent—Ingersoll Sergeant Drill Company, 10, Park-place, New York
Electrical Fibre Carbon Company, 1223-1234, Michigan-avenue, Chicago, Ill.

Franklin — Franklin Electric Company, 136, Liberty-st, New York
Fuller—Greeley (E. S.) Co, 5 and 7, Dey-st, New York
Gethins Gravity—Gethins Electrical Manufacturing Company, 620, Atlantic-avenue, Boston, Mass.
GONDA—**LECLANCHE BATTERY COMPANY**, 111-117, East 131st-st, New York. **See Advt., p. 448**
Hanson—Domestic Electric Power and Light Company, Baltimore, Md.
——— Falls City Electric Company, Louisville, Ky.
Hercules—Hercules Electric Company, 22, Custom House-place, Chicago, Ill.
High Rock—High Rock Battery and Novelty Company, 63, High Rock-st, Lynn, Mass.
Higgins Gravity Motor and Electric Gravity Clock Company, Chicago, Ill.
Hubbell—Consolidated Electric Motor Company, 77, Bedford-st, Boston, Mass.
Kolon—Marsh, C. D., 136, Liberty-st, New York
LECLANCHÉ (DISC and PRISM)—Leclanché Battery Company, 111-117, East 131st-st, New York **See Advt., p. 448**
Microphone Carbon—St. Louis Battery Manufacturing Company, 707, Locust-st, St. Louis, Mo.
Mystic Electric Motor Company, 120, Tremont-st, Boston, Mass.
New Atlantic—Electro-Chemical and Specialty Company, 136, Liberty-st New York
Pennock—Pennock Battery, Electric Light and Improvement Company, 334, Dearborn-st, Chicago, Ill
Perfect—Galvano Faradic Manufacturing Company, 300, 4th Avenue, New York
Salem Battery Company, Salem, Va.
Schwindt and Edelkamp, 610, Eighth-avenue, New York
Standard Gravity—Standard Battery Company, 334, Dearborn-st, Chicago, Ill.
Tilly and Van Hagen Company, 879, Gates-avenue, Brooklyn, New York
Tip—Kidder (Jerome) Manufacturing Company, 820, Broadway, New York
Turbayne—Turbayne-Tamblyn Company, 66-70, East Foot-st, Detroit, Mich.
Willoughby—Standard Battery Company, 334, Dearborn-st, Chicago, Ill.

BATTERIES, STORAGE, MAKERS OF.

Accumulator Company, 224, Chestnut-st., Philadelphia, Pa.
Accumulator and Motor Company, New Brighton, New York
Acme—Acme Storage Battery and Manufacturing Company, 29, Broadway, New York
American Standard Battery Company, 66½, Pine-st, New York
Bacon, Chas., Rock Hill, Conn.
Brush—Brush Electric Company, Belden-st, near Mason-st, Cleveland, Ohio
Bunnell (J. H.) & Co, 76, Cortlandt-st, New York
Bradbury-Stone Electric Storage Company, Lowell, Mass.
Chloride—Electric Storage Battery Company, Drexel-bldg., Philadelphia, Pa.
Coleman—Coleman Battery Company, Chicago, Ill.
Conqueror—Hero Electric Company, 78 and 80, Cortlandt-st, New York
Consolidated Electric Storage Company, 44, Broad-st, New York
Crescent—Minneapolis Electric and Construction Company, 27, South Fourth-st, Minneapolis, Minn.
Crowdus—Crowdus Chemical Electric Company, Memphis, Tenn.
Detroit—Woodward Electrical Company, 69, Griswold-st, Detroit, Mich.
Donaldson-Macrae Electric Company, 215, N. Calvert-st, Baltimore, Md.
Eaton, A. K., 46, Lexington-avenue, Brooklyn, N.Y.
Edco—Electro Dynamic Company, 224, Chesnut-st, Philadelphia, Pa.
Edison-Lalande—General Electric Company, 620, Atlantic-ave, Boston, Mass.; and Edison-bldg, New York.
Elastic—McRae, V. H., 87, Pulitzer-bldg, New York
Electric Power and Storage Company, Havemyer-bldg., New York; and Ashland, Wis.
Electric Road Carriage Company, 101, Milk-st, Boston, Mass.
Electrical Accumulator Company, 44, Broadway, New York; and Chicago, Ill.
Electrical Storage Battery Company, Allegheny-avenue, Philadelphia, Pa.
Ford-Washburn—Ford-Washburn Store-Electro Company, Cleveland, O.
Franklin — Franklin Electric Company, 136, Liberty-st, New York
1891—Foster, O. A., 8, Oliver-st. Boston, Mass.
Globe Storage Battery Company, Chicago, Ill.
Hero—Hero Electric Company, 78-80, Cortlandt-st, New York
Hussey Battery Company, 144, Greenwich-st, New York
Ideal—Bradbury-Stone Electric Storage Company, 1, 5 and 7, Grand-st, Lowell, Mass.
Johnson Storage Battery Company, 10, Mount Washington-st, Mass.
Knowles — General Electric Company, Boston, Mass.; and New York
Law—Law Battery Company, 85, John-st, New York
Lloyd & Paxton, Limited, 2, Wall-st, New York
Logan—Standard Electric Company, Detroit, Mich.
Loomis—Eureka Electric Company, 18, Broadway, New York.
Macracon—Macracon Storage Battery Company, 7, Wall-st, New York
Main—Union Electric Constructing Company, 312, North Eleventh-st, St. Louis, Mo.
Mason—Mason Electric Company, 10 and 12, Vandewater-st, New York
Molecular Storage Battery Company, 95, Milk-st, Boston, Mass.
Morris, H. G., Drexel-bldg, Philadelphia, Pa.
Morrison-Planté—American Battery Company, 188, Madison-st, Chicago, Ill.
National Storage Battery Company, Limited 626, Hammond-bldg, Detroit, Mich.
Neutral Storage Battery Company, Newark N.J.

O'Keenan Electric Manufacturing Company, 45, Broadway, New York
Pacific Electrical Storage Company, 118-120, Pine-st, San Francisco, Cal.
Partrick & Carter Company, 125, South Second-st., Philadelphia, Pa.
Pumpelly-Sorley — Pumpelly-Sorley Storage Battery Company, 170, South Clinton-st, Chicago, Ill.
Rendrock Powder Company, 23, Park-place, New York.
Roberts—Roberts-Brevoort Electric Company, 208, Broadway, New York
Rowley—Clark & Marshall, 345, The Rookery, Chicago, Ill.
Samson—Electric Gas Lighting Company, 195, Devonshire-st, Boston, Mass.
Schuyler—Schuyler Electric Company, Middletown, Conn.
Silvey—Dayton Manufacturing Company, Dayton, O.
Smyth, C. A., Front and Locust-streets, Momence, Ill.
Sorley—Eastern Electric Light and Storage Battery Company, 37, Market-st, Box 406, Lowell, Mass.
Standard Electric Company, Detroit, Mich.
Syracuse—Syracuse Storage Battery Company, Syracuse, N.Y.
Taylor—Taylor Battery Company, 51, Dey-st, New York
Union Electric Company, 45, Broadway, New York; and Orangeburgh, N.J.
Union—Union Electric Co, 45, Broadway, New York
Usher—Hopedale Electric Company, Boston, Mass.
Vail, W. A., 126, Liberty-st, New York
Waddell-Entz — Waddell-Entz Company, 203, Broadway, New York
Western—Western Electric Company, 227, South Clinton-st, Chicago, Ill., and New York
Woodward Tubular — International Storage Battery Company, Detroit, Mich.

CABLES, SUBMARINE (*see* Electric Cable Makers).

CARBON MAKERS AND DEALERS.

Boulton Carbon Manufacturing Company, North Tonawanda, N.Y.
Brush Electric Company, Belden-st, near Mason-st, Cleveland, Ohio
Crouse-Tremaine Carbon Company, Fostoria, O.
Globe Carbon Company, Ravenna, Ohio
National Carbon Company, 40, Willson-avenue, Cleveland, Ohio
New York Carbon Works, 18, Cortlandt-st, New York
Solar Carbon and Manufacturing Company, 95, Fifth Avenue, Pittsburgh, Pa.

CENTRAL STATION VOLT- AND AMMETER MAKERS.

Weston Electrical Instrument Company, 114 to 120, William-st, Newark, N.J.

CENTRAL STATIONS, CONTRACTORS FOR THE CONSTRUCTION AND MAINTENANCE OF.

Brush Electric Company, Belden-st, Cleveland, Ohio
Fort Wayne Electric Company, Fort Wayne, Ind.
General Electric Company, 620, Atlantic-avenue, Boston, Mass.; and Broad-st, New York
Great Western Manufacturing Company, 195-207, S. Canal-st, Chicago, Ill.
Western Electric Company, 227, South Clinton-st, Chicago, Ill.
Westinghouse Electric and Manufacturing Company, Pittsburgh, Pa.

CONDUITS.

Brooks Underground Telegraph Construction Company, 307, Walnut-st, Philadelphia, Pa.
Builders Insulating Tube Company, 825, Washington st, Lynn, Mass.
Cummings & Engellman Conduit Company, Telephone-bldg, Detroit, Mich
Fibre Conduit Company, 45, Broadway, New York
Interior Conduit and Insulation Company, 42 and 44, Broad-st, New York

DYNAMO BRUSHES, MAKERS OF.

Wirt, Charles, 56, Fifth-avenue, Chicago, Ill. (Maker of the Wirt Dynamo Brush)

DYNAMOS, MAKERS OF.

Adams—Commercial Electric Company, 113, South Tennessee-st, Indianapolis, Ind.
Adams Electric Company, 100, Beacon-st, Worcester, Mass.
Akron—Akron Electrical Manufacturing Company, Akron, O.
American—New American Electrical Arc Light Company, 2, Cortlandt-st, New York
American Motor and Dynamo Company, Denver, Colo.
Arnold Electric Co., Chester, Pa.
Astoria Electrical Manufacturing Company, 14, Dey-st, New York. Factory: Astoria, N.Y.
Aurora—Aurora Electric Company, 2218 to 2220, Emerald-st, Philadelphia, Pa.
Averill—Onondaga Dynamo Company, 225-229, Walton-st, Syracuse, N.Y.
Ball—Ball Electric Light Company, 404, W. Twenty-seventh-st, New York
Bowers, Geo. E., 527, Main-st, Fitchburg, Mass.
Brush—Brush Electric Company, Belden-st, near Mason-st, Cleveland, Ohio
C. and C.—C. & C. Electric Company, (Incorporated) 143, Liberty-st, New York
C.P.—Easton Electric Company, 643, Kent-av, Brooklyn, N.Y.
Card—Card Electric Motor and Dynamo Company, Cincinnati, Ohio
Carpenter Electric Company, 116-118, Franklin-st, Chicago, Ill.
Clark—Clark Electric Company, 192, Broadway, New York
Cohen—National Electric Light and Power Company, Bullitt-bldg, Philadelphia, Pa.

PUBLICATIONS, ELECTRICAL.

Electric Power (monthly), 36, Cortlandt-st, New York. Price $3 per annum
Electrical Age (weekly), Room 12-13, World-bldg, New York. Price $4 per annum
Electrical Engineer (weekly), 203, Broadway, New York. (Annual subscription within Postal Union, $5 = £1 1s.)
Electrical Engineering (monthly), 565, The Rookery, Chicago, Ill. (Ann. Sub., P.U. $4)
Electrical Industries (monthly), 351, The Rookery, Chicago, Ill. Price $3 per annum
Electrical Literature (monthly), 565, The Rookery, Chicago, Ill.
Electrical Review (weekly), 13, Park-row, New York. Price $5 per annum
Electrical and Street Railway Reporter (monthly), 136, Liberty-st, New York
Electrical World, The (weekly), 167-177, Times-bldg, New York. Price £1. 5s. per ann.
Electricity (weekly), 16, Park-place, New York, and at Chicago, Ill.; and Boston, Mass. (Ann. sub., P.U., $4.50 = 19s.)
India Rubber World and Electrical Trades Review (monthly), 192, World-bldg, New York. Price $3 = 12s. 6d. per annum
Physical Review (monthly), Cornell University, Ithaca, N.Y. (Ann. Sub. $3)
Power (monthly), 145 and 146, World-bldg, New York. (Ann. Sub. P.U., 6s. 3d.)
Practical Electricity (fortnightly), 620, Atlantic-avenue, Boston, Mass. Price 9s. 6d. per annum
Progressive Age (semi-monthly), 280, Broadway, New York; and at Boston, Mass. (Ann. sub., 13s. 6d.)
Revista Telegraphica de Mexico (twice a month), Calle del Refugio 15, Mexico. Price $5 per annum
Scientific American (weekly), 361, Broadway, New York. Annual subscription, Europe, $4
Scientific American Supplement (weekly), 361, Broadway, New York. Annual subscription, Europe, $6
Transactions of the American Institute of Electrical Engineers (monthly), 12, West 31st-st, New York. Ann. sub., $5
Western Electrician (weekly), 6, Lakeside-bldg, Chicago. Price (P.U.) $5 per annum.

PUBLISHERS.

DIAGO, FREDERIC C., 30, Oficios-st, P.O. Box 278, Havana, Cuba. **See Advt., p. 496**
Johnston (W. J.) Company, 167-177, Times-bldg, New York
Munn & Co, 361, Broadway, New York
Van Nostrand (D.) Company, 23, Murray-st, and 27, Warren-st, New York

RAILWAY AND TRAMWAY (ELECTRIC) ENGINEERS AND CONTRACTORS.

Allen Electric Supply Company, 232-234, Carter-st, Philadelphia, Pa.
American Railroad Improvement Company, 95, Milk-st, Boston, Mass
Astoria Electrical Manufacturing Company, 14, Dey-st, New York. Factory: Astoria, N.Y.
Barry (J. F.) & Co, 52 William-st, New York
Central Power Company, Newark, N.J.
Cleveland Electric Railway Co, Cleveland, O.
Complete Electric Construction Company, 121, Liberty-st, New York
Curtis Electric Manufacturing Company, Pacific-avenue, Jersey City, N J.
DIAGO, FREDERIC C., 30, Oficios-st, P.O. Box 278, Havana, Cuba. **See Advt., p. 496**
Electric Construction and Supply Company, 18, Cortlandt-st, New York
Electric Railway Engineering Company, 180, Summer-st, Roston, Mass.
Electric Tramway Maintenance Company, 1, Broadway, New York
Electrical Conduit Traction Equipment Company, 94, Wall-st, New York
Electrical Construction and Manufacturing Company, 108, North Eutaw-st, Baltimore, Md.
Field Engineering Company, 143, Liberty-st, New York
Lindsay & Wilgus, 59, William-st, New York
Love Electric Traction Company, 817, The Rookery, Chicago, Ill.
McQuesten, William D., 15, Cortlandt-st, New York

"THE ELECTRICIAN"

ELECTRICAL TRADES' DIRECTORY

AND HANDBOOK, 1894.

BIOGRAPHICAL SECTION.

(*Specially prepared for this* DIRECTORY AND HANDBOOK.)

ABDANK-ABAKANOWICZ, Bruno. Born in Wilkomir (Poland), 1852.

Mr. Abdank-Abakanowicz was educated at the Riga Polytechnicum, and graduated in 1873. From 1874 he occupied the chair of Graphical Statics and Applied Mechanics at the Polytechnic School at Lemberg (Austria) until 1881, when he went to Paris and established himself there as a consulting engineer. He is the author of a treatise on "Graphical Statics" (Lemberg, 1876), "Integrating Machines" (1881). In 1886 he published a book on new integrating machines of his invention (Les Integraphes), and in the year 1890 he published a book in German on integrating apparatus. He is the author of many Papers that have appeared in the *Comptes Rendus* of the Academy of Sciences, in Paris, and in various translations. He is a member of the Société de Physique and of the Council of the Société Internationale des Électriciens. In 1889 he organised the United States section of the Exhibition at Paris, and was nominated member of the Jury. He is a Knight of the Legion of Honour.

ABEL, Sir Frederick Augustus, Bart., K.C.B., D.C.L. (Oxon.), D.Sc. (Cant.), F.R.S. Born in 1827.

Sir F. A. Abel was Demonstrator of Chemistry at St. Bartholomew's Hospital in 1852, Professor of Chemistry at the Royal Military Academy (in succession to Prof. Faraday), Chemist of the War Department from 1854, President of the Government Commission on Explosives 1888-91, a member of the Royal Engineers' Committee, and associate member of the Ordnance Committee. He retired in 1891 from Government service. He is Past-President of the Institute of Chemistry, of the Society of Chemical Industry, of the Chemical Society, of the Institution of Electrical Engineers, of the British Association, of the Iron and Steel Institute, and Chairman of Council of the Society of Arts. He is Royal Medallist for researches in explosives, was a member of the Royal Commissions on Accidents in Mines, on Noxious Vapours, &c., hon. member of the Institute of Civil and Mechanical Engineers, of the Royal United Service Institution, and of the German Chemical Society, Telford Medallist, and Albert Medallist. He was created C.B. in 1877, was Commissioner to the Electrical Exhibition at Vienna in 1883, was knighted in that year, created K.C.B. early in 1891, and made a baronet in 1893. He was Bakerian Lecturer in 1867, and Rede Lecturer in 1888. He is secretary and director of the Imperial Institute, Warden of the Goldsmiths' Company, and member of the Royal Commission for the Chicago Exhibition.

ADAMS, Prof. W. Grylls, M.A., D.Sc., F.R.S., Past-President S.T.E. and E. Born in 1836.

In 1855 Mr. Adams entered at St. John's College, Cambridge, and took high honours in the Mathematical Tripos in 1859. He was elected a Fellow of St. John's College, and for four years in succession was appointed Examiner in Physics for the Natural Science Tripos. Prof. Adams was again appointed Examiner in Physics in the University of Cambridge for the year 1887-88, and was re-elected for the following year. For two periods of five years each he has been Examiner in Experimental Physics in the University of London, and is one of the representatives of that University on the Board, and is a member of the Council for the Extension of University Teaching in London. In 1864 he assisted Prof. Maxwell in his celebrated experiments at King's College to determine the value of the ohm. In 1865 Prof. Adams was appointed Professor of Natural Philosophy in King's College, as successor to the late Prof. Maxwell. The Physical Laboratory, under the charge of Prof. Adams, was established in the year 1868 for practical study and research in all

Digitized by Google

branches of experimental physics. Prof. Adams is a Fellow of the Royal Society, a Past-President of the Society of Telegraph-Engineers and Electricians, and a Past-President of the Physical Society of London. In the spring of 1881 he gave a course of Cantor Lectures at the Society of Arts on "The Scientific Principles involved in Electric Lighting," in which he treated the subjects of electrical measurement, the efficiency of dynamo machines, and arc and incandescent lighting. He was on the Jury of the Crystal Palace Electrical Exhibition in 1882, was also a member of the International Congress of Electricians at Paris in 1881, and chairman of the Lightning Rod Conference, which published a report on the subject in 1882. Prof. Adams has written Papers on "Magnetic Disturbances and Earth Currents," published in Report of British Association, 1881; also on "Equipotential Surfaces"; and on "The Action of Light on Selenium," which have been published in the *Proceedings* and in the *Transactions* of the Royal Society. In his address as President of the Mathematical and Physical Section of the British Association at Swansea in 1880, Prof. Adams gave an account of recent investigations by M. Pictet and others in the "border land" between chemistry and physics. He reviewed the recent progress in spectrum analysis, and drew attention to the magnetic change and disturbances on the earth as in a great measure due to the action of the sun. In 1881 he communicated to the British Association a report on the comparison of Magnetic Disturbances at the different Observatories, and still more recently has been carrying on investigation, on this subject, which have been published in the *Philosophical Transactions* of the Royal Society. In 1885 he reported on the South Foreland experiments on Lighthouse Illuminants, and gave some of the results of his investigations to the British Association at Aberdeen in his lecture on "The Electric Light and Atmospheric Absorption." In December, 1888, Prof. Adams was created Doctor of Science in the University of Cambridge.

ALBRIGHT, J. F., C.E., M.E., E.E. Born in Birmingham, 1857; educated at a private school at Tottenham; matriculated at the London University in 1874; was for nearly two years at the Crystal Palace Engineering School; about three years with Sir J. Bazalgette as a pupil on various works; and afterwards, in the employment of the Metropolitan Board of Works, on the new Storm Overflow Works.

In the summer of 1880 Mr. Albright joined the Swan Company in Newcastle, and at once commenced work on the "Servia." He afterwards took charge of the Company's Crystal Palace exhibit, and did various other work till the amalgamation took place with the Edison Company, when he was instructed to superintend all the ship-lighting work of the joint companies. Shortly after the beginning of 1883 he was appointed Resident Engineer in charge of all the work of the Edison-Swan Company, except the land work carried out in the North, which was then superintended by Mr. J. W. Edmundson. Before long Mr. Albright took entire charge of all contract work for the above company, and continued to do so until the spring of 1884, when he left the Edison-Swan Company to go into partnership in the firm of R. E. Crompton and Co. (now Crompton and Co., Limited), of which he is Managing Director. He is also Chairman of the Crompton-Howell Electrical Storage Company, and a Director of the Crompton Electric Supply Company of Australia, of the Birmingham Electric Supply Company.

ANDERSEN, F. V. Born July 10, 1852.

Mr. Andersen, in 1870, entered the service of the Danish Government Telegraphs, from 1872 to 1882 residing in Copenhagen. While in the telegraph service he kept a school in electrotechnics and languages for aspirants to appointment in the service. During this period he made his first essay as an inventor; he devised a Gramme machine, but found, on trying to put the same into practice, that he had been anticipated. He joined an instrument-maker, whom he supplied with several successful designs in telephones, electric clocks, &c. After having seen the Electrical Exhibition in Paris, Mr. Andersen obtained employment with the Electrical Power Storage Company, in London. During the latter part of his stay with this firm he was in charge of the laboratory, and through a series of careful experiments helped to establish the now well-known rules for the best practical working of secondary batteries. He proved in 1884 the important fact which recently has been pointed out by Prof. Ayrton, that the action in the cell as constructed in the ordinary manner —with connections at the top of both sets of plates—is stronger near the top than at the bottom, and he devised a cell with bottom connections to the spongy plates in which this defect was remedied. His experiments on this cell showed that the same number of plates have, when used in this manner, 15 per cent. more capacity than when worked in the ordinary way. While with the Electrical Power Storage Company he made a most careful study of the dynamo-machine, which in their factory was represented almost in all its important types, and worked out a set of empirical formulæ by means of which he has been able to calculate with great exactness dynamos in all sizes. At that time (1883) he devised the first electro-magnetic cut-out, the automatic charging-switch, and various other apparatus. At the end of 1884 he joined Messrs. Latimer Clark, Muirhead and Co. with a view to devoting himself to dynamo work and the electric light generally. With this firm he designed the "Westminster" dynamo, of which type a great many excellent machines are now working, and brought out improvements in arc lamps, ships' telegraphs, &c. In the beginning of 1888 he devised the special system of electric light distribution which is known under the term "distribution by a ring-main," and which at the same time was introduced in Germany by Mr. Fritsche. The system was

Digitized by Google

Digitized by Google

WILLIAM THOMAS ANSELL.

Digitized by Google

specially designed by Mr. Andersen for the St. James's district, and he devised a new form of iron culvert to meet the many difficulties which in this district presented themselves against an underground system of heavy mains. Mr. Andersen won, in connection with a friend, the prize for the best design of an electro-motor in the competition opened by *Industries* in 1886. He now practises as a consulting electrical engineer and electrician.

ANDREWS, J. D. F., M.I.E.E., A.M.I.C.E.

After an early education in Germany, during the period of the Franco-German War, Mr. Andrews started his business career in the publishing office of Messrs. Smith, Elder and Co.; but this class of occupation not conforming with his mechanical tendencies, he solicited the favour of Sir William Siemens, by whose kindness he was placed in the works at Charlton as pupil, and obtained an excellent insight into the various departments, extending over five years. At the expiration of this period Mr. Andrews took charge of the electric-light department of Messrs. Latimer Clark, Muirhead and Co., where he remained until he was induced to undertake the management of a new company in Scotland. The life of this company was not long, and Mr. Andrews started the firm of J. D. F. Andrews and Co., which he carried on at Woodside Electric Works for over five years, after which the business merged into that of Messrs. Muir, Mavor and Coulson, in which firm Mr. Andrews became a partner. During this period the central supply stations in Glasgow were established by the firm, who later on sold this part of their business to the Corporation of Glasgow when the firm dissolved partnership, and Mr. Andrews returned to London. Here he opened up business again as J. D. F. Andrews and Co., and has since continued. Mr. Andrews has made many inventions that have established his reputation in the electrical world. Those that have received most extended adoption are his dynamo, which is of the four-pole type, having a ring armature, the coils of which are connected in series in such a way that only two collecting brushes are required. Mr. Andrews' arc lamp is well known, also his switches, regulators, and various accessories of electric light installations, which have been adopted both in land and ship installations to a large extent. The most important of Mr. Andrew's inventions, however, is the system of concentric wiring, in which the outer conductor is entirely bare. This system he has perfected in every detail, and he has overcome the prejudice that very strongly existed to the use of a bare conductor, both in the minds of the general public and especially with some of the insurance companies. The system has marked features of advantage, and is rapidly extending in all classes of installations.

ANSELL, William Thomas, F.R.G.S., M.I.E.E. Son of Dr. Ansell; born in London, November, 1822; educated at Bruce Castle, Tottenham, &c., and at Paris.

After spending some years on his paternal estate in Berbice, West Indies, Mr. Ansell, on his return to England in 1845, joined the service of the Electric Telegraph Company, prior to its incorporation in March, 1846, under the auspices of the late John Lewis Ricardo, M.P. Mr. Ansell remained in the service of this parent and pioneer company as District Superintendent and Engineer, and, finally, as General Superintendent, till its transfer to the Government in 1870. In consequence, however, of impaired health, through the severity of his duties as General Superintendent, he obtained leave of absence from 1858 to 1861; but the energy which had characterised his official career was ill-suited to an idle life, and quickly utilising the opportunity thus afforded him, he accepted temporary service in the Levant and in Turkey, under Messrs. Newall and Co. On his return to England Mr. Ansell was appointed General Superintendent and Engineer in Ireland for the Electric and International Telegraph Company. On the transfer of the telegraphs to the State, in 1870, Mr. Ansell, accepting a pension, transferred his services to the Eastern Telegraph Company and associated companies as Traffic Superintendent. It has been his good fortune during his career to be always in the vanguard of those employed in extending and organising the telegraphic system, and no man is, perhaps, better known and esteemed throughout the length and breadth of the land than the subject of this brief notice. Mr. Ansell is a Fellow of the Royal Geographical Society, and a Member (and ex-Member of the Council) of the Institution of Electrical Engineers.

ARRHENIUS, Svante August, Ph.D., Stockholm. Born near Upsala (Sweden), in 1859, and educated at the Gymnasium and University, Upsala; became Philosophical Doctor and Instructor at this University in 1884, and Teacher of Physics at the University of Stockholm in 1891.

From 1881-85 he worked experimentally at the Physical Institute of the Academy of Science, in Stockholm, under Prof. Edlund, and afterwards was sent out by this Academy to study experimental physics and physical chemistry at foreign institutes. It was then that he attended (1886-88) the laboratory for physical chemistry of Prof. Ostwald in Riga (afterwards in Leipsic), the physical institutes of Prof. Kohlrausch in Wurzburg, Prof. Boltzmann in Graz, and the laboratory for physical chemistry of Prof. van 't Hoff in Amsterdam. Once more, in 1889 and 1890 we find him at the universities of Leipsic and Graz. His researches, which have been published in several languages (Swedish, German, English, French, Dutch, and Russian), relate mostly to the electric conductivity of electrolytic solutions and their qualities. To explain these he established the theory of electrolytic dissociation, according to which the various salts in very diluted solutions dissociate into their electrolytic elements. As an example, it may be mentioned that NaCl in 1 per cent. solution gets dissociated into Na and Cl at a rate of about 90 per cent. His other researches refer to the conductivity of gases and the

Digitized by Google

phenomena of atmospheric electricity. In 1891 he proved that the vapour of salts, brought into a Bunsen flame, conducts electricity in the same way as do electrolytes.

ATKINSON, Llewelyn Birchall, A.K.C., A.M.I.C.E. Born at Builth, Breconshire, in 1863. Educated at Merchant Taylors' School and King's College, London.

Mr. Atkinson was first educated at Merchant Taylors' School, where his scientific knowledge was gained in the classes and laboratories set apart for the study of chemistry, physics, and geology. He also attended the evening classes then just commencing under Prof. Ayrton at the Finsbury Schools, which have since developed into the Finsbury Technical College, and in 1881 obtained the Silver Medal in honours, at the first examination held by the City Guilds on Electric Lighting and Power Transmission. After leaving Merchant Taylors' School he entered the Department of Applied Sciences at King's College, London, where in the first year he was awarded the Sambroke exhibition, and in the second and third year the Jelf Medal, awarded to the student of either year who most distinguished himself. After leaving King's College, of which he was elected an associate, he entered the works of Messrs. Kitson and Co., Airedale Foundry, Leeds, and there gained a thorough knowledge of the details of a large engineering works. In 1884 he entered the Halifax works of Messrs. W. T. Goolden and Co. (then Goolden and Trotter) as a pupil, and afterwards with them was engaged as an engineer, and later on joined the firm as a partner. He has taken (in conjunction with his brother, Mr. C. W. Atkinson) a very prominent part in the introduction of electrical power to mining operations, more particularly in coal mining, and is the inventor and patentee of a great variety of appliances and methods of construction in connection with electric mining machinery. He is also the inventor and patentee of many other electrical contrivances and arrangements, including the production and application of alternating currents for motive power. He was entered as a student of the Institution of Civil Engineers in 1883, and whilst a student was awarded a Miller Prize for a Paper on "Electrical Measuring Instruments," in which was published for the first time a method of measuring the power in an alternating circuit, by means of two quadrant electrometers, with the needles mechanically connected. In 1890-1 he was the joint author (with his brother, Mr. C. W. Atkinson) of a Paper read before the Institution of Civil Engineers, upon Electric Mining Machinery, for which two Telford Medals and premiums were awarded to the authors. This Paper has been republished in America, France and Belgium. He is also joint author with his brother of a Paper read before the Mining Institution of Scotland, on the "Applications of Electricity to Mining," as also of a Paper on a similar subject read before the Staffordshire Institute of Mining Engineers. Mr. Atkinson is a member of the North of England Institute of Mining and Mechanical Engineers.

AYLMER, John. Born in Bath on July 24th, 1841; educated by private tuition, afterwards at Carnarvon, and at the Ruabon Grammar School, under the Rev. A. L. Taylor.

In 1859 Mr. Aylmer entered the chemical laboratory of the late Mr. Dugald Campbell, in Chancery-lane, where he worked at practical chemical analysis for a couple of years, and then joined the firm of Messrs. Siemens Brothers at that time Siemens and Halske), where he was associated with the late Mr. Schwendler and the late Mr. R. Sabine in electrical testing and in carrying on telegraphic work. He was sent abroad as representative of the firm, and was for some years engaged in erecting telegraph lines, chiefly in Spain, and assisting in submarine cable-laying expeditions. In 1871 Mr. Aylmer fixed himself in Paris, practising on his own account as an electrical engineer, and became the foreign agent of the late Sir Charles Wheatstone. It was through his efforts, and under his immediate superintendence, that the Wheatstone fast-speed automatic telegraph was established on the chief French lines. He also put this system to work on the Italian, Russian, and Spanish lines. When the great Electrical Exhibition held in Paris in 1881 was being prepared, Mr. Aylmer took in hand the organisation of the British section; and it was in consequence of his personal efforts that our chief electrical inventors and manufacturers were induced to exhibit. When, later on, the British Government named a commission to carry on the section, Mr. Aylmer was appointed the hon. secretary, and continued the work he had so well begun. At the close of that Exhibition the French Government showed its appreciation of his services in connection with it by bestowing upon him the decoration of Chevalier of the Legion of Honour. In 1881 the King of Spain created him a Knight Commander of the Royal Order of Isabel la Catolica, in recognition of his services to the Government of that country; and in 1883 the British Government appointed him as one of the English representatives at the International Congress that met in Paris and fixed the standard electrical units that are now universally used. When preparations were being made in this country for its participation in the great Universal Exhibition held in Paris in 1889, Mr. Aylmer took an active part in the organisation of the British section; and, in 1888, the executive committee formed at the Mansion House, under the presidency of the Lord Mayor, to work that section, appointed him their honorary local secretary in Paris. Mr. Aylmer was named one of the two English members of the jury for Class 62 (Electricity) at this Exhibition; and at its close the French Government bestowed upon him the decoration of Officer of the Legion of Honour in recognition of his services. At the Paris meeting (1890) of the International Telegraphic Conference Mr. Aylmer represented the Colonies of New Zealand and New South Wales. He has acted as hon. local secretary and treasurer in France to the Institution of Electrical Engineers since its formation as the Society of Telegraph Engineers and Electricians. He is a member of the Council of the Société Internationale des Electriciens.

W. E. AYRTON.

Digitized by Google

AYRTON, Prof. W. E., F.R.S. Educated at University College School, where he gained numerous prizes, and entering subsequently into the College, gained the Andrews Exhibition in 1865 and the Andrews Scholarship in 1866.

Passing the examination with honours for his first B.A. in 1867, Mr. Ayrton in the same year came out first in the Entrance Examination for the Indian Government Telegraph Service. He was then sent by the Secretary of State for India to study electrical engineering with Prof. Sir William Thomson, coming out first at the Advanced Examination for the Indian Government Telegraph Service, and won the Scholarship. When in India Prof. Ayrton acted first as the Assistant Electrical Superintendent, and subsequently as the Electrical Superintendent in the Government Telegraph Department, introducing, with the late Mr. Schwendler, throughout British India, a complete system of immediately determining the position of a fault in the longest telegraph line by electrically testing at one end. In 1872-3 Prof. Ayrton was on special duty in England on behalf of the Indian Government Telegraph Department, and in charge of the Great Western Telegraph Manufactory in London, on behalf of the engineers, Prof. Sir William Thomson and the late Prof. Fleeming Jenkin. From the latter year until 1879 Prof. Ayrton was the Professor of Natural Philosophy and of Telegraphy at the Imperial College of Engineering, Japan, the largest English-speaking Technical University in existence at that date. In 1879 he was appointed Professor of Applied Physics at the City and Guilds of London Technical College, Finsbury, and in 1884 the Chief Professor of Physics at the Central Institution, South Kensington, of the City and Guilds of London Institute; in 1880 a Secretary of the Mathematical and Physical Section of the British Association; and in 1881 was elected a Fellow of the Royal Society.

Prof. Ayrton is a Past President of the Physical Society and of the Institution of Electrical Engineers, and is a Member of Council of the British Association, a Governor of the Imperial Institute, and a Member of the Council of Almoners of Christ's Hospital; he has been a Juror in the majority of the Electrical Exhibitions in England and abroad, was one of the English Government delegates to the Electrical Congress at Chicago, and is joint editor of Cassell's "Manuals of Technology," and the author of "Practical Electricity," the most recently-published work in this series, but already in its seventh edition. His lecture on the "Electric Transmission of Power," given at the meeting of the British Association at Bath, in 1888, was so much appreciated that, at the request of the town, this lecture was repeated to an audience of 3,000, the first time in the annals of the British Association that one of their lectures has been repeated. With Prof. Perry he is the joint inventor of the well-known ammeters, voltmeters, electric power meter, ohmmeter, dispersion photometer, transmission dynamometer, dynamometer coupling, governed electric motor, oblique coiled dynamo machine, and secohmmeter; and, with the late Prof. Fleeming Jenkin and Prof. Perry, of the system of automatic electric transport known as "Telpherage."

About one hundred Papers which have been published in the *Proceedings and Transactions* of the Royal Society, Physical Society, Society of Telegraph Engineers, and other societies have been contributed by Prof. Ayrton conjointly with Prof. Perry and others, of which some of the most important are: "The Specific Inductive Capacity of Gases"; "The Contact Theory of Voltaic Action"; "A New Determination of the Ratio of the Electromagnet to the Electrostatic Unit of Quantity"; "A Duplex Partial Earth Test"; "Electricity as a Motive Power"; "Experiments on the Heat Conduction of Stone"; "On a Neglected Principle that may be Employed in Earthquake Measurements"; "The Magic Mirror of Japan"; "Electric Railways"; "Measuring Instruments used in Electric Lighting and Transmission of Power"; "Economic Use of Gas Engines"; "Electromotors and their Government"; "A New Form of Spring for Electric and other Measuring Instruments"; "The Gas Engine Indicator Diagram"; "The Most Economical Potential Difference to use with Incandescent Lamps"; "The Winding of Voltmeters"; "Economy in Electrical Conductors"; "Uniform Distribution of Power from an Electrical Conductor"; "Modes of Measuring the Coefficients of Self and Mutual Induction"; "The Driving of Dynamos with very Short Belts"; "Portable Voltmeters for Measuring Alternate or Direct Potential Differences"; "The Magnetic Circuit in the Dynamo"; "The Efficiency of Incandescent Lamps with Direct and Alternate Currents"; "Galvanometers"; "Interference with Alternate Currents"; "Measurement of the Power given by any Current to any Circuit"; "Quadrant Electrometers"; "The Thermal Emissivity of Thin Wires"; "The Efficiency of Transformers, and the Regulation of Transformers at Different Frequencies." Prof. Ayrton, with Prof. Perry, has also taken out twenty-six patents in Great Britain, several of them also in France, Germany, America, and other foreign countries; and he is also co-patentee with Mr. Mather of various electrical measuring instruments.

BADT, Lieut. Francis B. Born Oct. 4, 1849.

In 1869 Lieut. Badt joined the Prussian artillery. During the Franco-Prussian War of 1870-71 he was Second Lieutenant in the Eleventh Regiment of Field Artillery attached to the army of Crown Prince Frederick William, the late Emperor Frederick III. He took part in twenty-two battles and assaults, among them the battle of Sedan and the siege of Paris. He was decorated for bravery with the iron cross and a campaign medal. He left the service in 1881 and went to the United States. In January of the following year he entered the service of the United States Electric Lighting Company, and in the spring went to Chicago as representative of the Company. In 1888 he was transferred to the New York office of

Digitized by Google

the Company, and during the summer was sent as its representative to Europe, on a confidential mission. After travelling in Europe for six months, he returned and joined the Western Electric Company. He remained with this corporation until he received the appointment of Superintendent of the Engineering Department of the Edison Company. On Nov. 1, 1890, Lieutenant Badt resigned his position with the Edison Company, and accepted the position of Manager of the Western Power and Mining Department of the Thomson-Houston Electric Company (now, with the Edison Company, forming the General Electric Company). During the last four years Lieutenant Badt has written several popular handbooks on electrical subjects. They are: "Dynamo Tenders' Handbook" (a new edition of which he has published), "Bell-Hangers' Handbook," "Incandescent Wiring Handbook," "Derivation of Practical Electrical Units," and "Electric Transmission Handbook." Lieutenant Badt is First Vice-President of the Chicago Electric Club. He was Consulting Electrical Engineer to the World's Columbian Exposition.

BAILEY, J. Born in London, July 24th, 1830; and at the age of fourteen obtained a situation in a mercantile office, where he remained for some years.

In 1848 Mr. Bailey entered the service of Messrs. Silver and Co., and was eventually appointed resident manager of the Silvertown Works, which at that time gave no promise of their present importance. During the length of time—more than 30 years—that Mr. Bailey has continued to manage at Silvertown his arduous duties have left him no leisure for literary work; we are glad to think, however, that he has contributed in a great measure to the success enjoyed by his firm.

BANDSEPT, A., A.M., C.E. Born at Strasburg, June 18, 1846; was educated at the higher Government Schools.

M. Bandsept is a member of the Société de Physique, and of other learned bodies. He is the delegate for Belgium of the Société Internationale des Électriciens, and is a member of the Committee of the Belgian Society of Engineers and Industrials.

M. Bandsept from time to time contributes to *The Electrician* valuable articles upon electrical science. He is also a frequent contributor to some French and Belgian periodicals. He has devoted considerable time and no little ability to the study of accumulators and the improvement of the incandescent light. Amongst other improvements in primary batteries, and especially in accumulators, M. Bandsept turned special attention to the means of recovering the work hitherto lost in secondary actions of electrolysis. He undertook a series of experiments to determine the molecular structure for electrodes which shall most assist the condensation effects to which elements dissociated by electricity are subject, and was thus led to construct his electrodes of finely-divided materials, compressed while being saturated with gaseous substances. While engaged in these researches M. Bandsept made several interesting scientific discoveries. He found, for instance, that in electrolytic action the state or nature of electrodes produced a kind of selection upon the radicals freed at their surface; so that bubbles are smaller and rise the more rapidly the finer the constituents of these electrodes. In taking very finely divided and pure carbon, direct reaction may occur between C and O, so that a chemical phenomenon is substituted for the physical one, by the only means of material division. Other mathematical investigations upon electric conduction led him to definite conductivity as an immediate consequence of atomic induction, and the conductor as a core of disturbance introduced in the field of force, being the path upon which the lines are directed. In fact, M. Bandsept denies that electric transmission is done by the ether, outside of the wire. His conclusions are that electricity is retained at the surface, and that the mechanism of propagation may be explained by reaction between the elements of the field and the intermolecular matter of the molecules at the surface of the wire. The demonstration proceeds from several abstract considerations on the constitution of matter in motion, articles on which have recently appeared. He has also devised several new combinations for primary and secondary batteries.

M. Bandsept has also employed with success his method of pulverisation for rendering materials fireproof, and for other industrial purposes. This method of mechanical pulverisation, first employed in the endeavour to modify the physical properties of bodies, led him to some remarkable experiments regarding the transmutation of metals. Articles to be coated are subjected to a jet of intense heat, whilst the impregnating substances are projected with great force on the heated surface. The principles of this transmutation are—rapid heating, so as to dilate only the uppermost atomic layers, and the sudden cooling which naturally ensues. The operation, therefore, results from two combined effects—molecular adherence (of the coating), and superficial tempering. In certain cases the latter effect may only result, and a direct exterior tempering be obtained, whilst the inner part of the metal is not affected. Very intense heat being required for such operations, M. Bandsept was led to interesting investigations upon flames obtained from gas previously and thoroughly mixed with the exact proportion of air or oxygen necessary to realise the conditions of the highest combustion By means of mechanical trituration, the gases are so diffused that they exist as a permanent mixture, somewhat like that obtained by suddenly cooling the elements of partial dissociation, even after combination has been effected. The previous mixture is so perfect and gives out such complete combustion, with such regular and continuous effect, that burners can be immersed in water, thus giving the least output by heating or evaporating. This rational system of combustion may be applied to different treatment; in fact, it reverses the ordinary condition of ebullition. M. Bandsept is a great student of molecular mechanics, which he considers will be the

Digitized by Google

mechanics of the future. M. Bandsept was appointed chief engineer of the Electrical Department International Brussels Exhibition, 1888 (Grand Concours), where he had the management of the whole installation, comprising 450 arc lamps and several hundreds of incandescent lamps. He contributed to make the electric lighting one of the principal, if not the chief, attraction of the Brussels Exhibition. He also had charge of the gas lighting, and constructed a new kind of intensive lamp, which obtained at the Paris Exhibition of 1889 a gold medal, the highest award given in Class 27. M. Bandsept is consulting engineer to several firms in Brussels making a speciality of experiments in lighting and heating and the manufacture of appliances therefor.

BAUR, Dr. C. Born in 1857 at Zürich, and educated at the Federal Polytechnikum.

Dr. Baur graduated in 1879 as Doctor of Philosophy in the University of Zürich, having written a Paper on the Magnetisation of Iron, which dealt with the magnetisation produced by very small forces, and on the influence of temperature on the permeability—some fundamental laws being established for the first time. In 1881-2 he continued his studies at the University of Berlin in Prof. Helmholtz's physical laboratory, where he brought out the "bolometer," simultaneously with Prof. Langley in America. This instrument is now in extensive use on the Continent for measuring radiant heat, replacing for that purpose the thermopile. In 1882 and 1883 he published two Papers on this instrument, and its application to the measurement of rock salt radiation. Dr. Baur has since occupied different positions, and has published some minor Papers, amongst them in 1886 a description of a new automatic temperature regulator. He is a Member of the Institution of Electrical Engineers.

BEDELL, Frederick, Ph.D. Born in Brooklyn, N.Y., U.S.A., 1868; educated at Montclair High School, Yale University and Cornell University.

Mr. Bedell pursued the regular classical or arts course in Yale College, where he was the recipient of various prizes and honors, particularly in mathematics and the natural sciences, although he attained distinction in other lines as well, and at the completion of his course stood third in his class in general scholarship. He graduated in 1890 as Bachelor of Arts with high honors, being one of three to receive the appointment for a Philosophical Oration. His university education was obtained at Cornell University, where he was appointed Fellow in Electrical Engineering for 1891-92 by a unanimous vote of the faculty. He received the degree of Doctor of Philosophy from Cornell University in 1892, was then appointed instructor in the Department of Physics under Dr. E. L. Nichols, and in 1893 was appointed Assistant-Professor of Physics in the same place. Dr. Bedell is a member of the Honorary Literary Society of Phi Beta Kappa, the Honorary Scientific Society of Sigma Xi, and of Alpha Delta Phi; also of the American Association for the Advancement of Science, American Society of Mechanical Engineers, and of the American Institute of Electrical Engineers. His writings, which have appeared in various scientific and engineering journals and in the *Transactions* of societies, have been widely copied and translated. Much of his work has been in conjunction with Dr. A. C. Crehore, with whom he published, in 1892, the treatise entitled "Alternating Currents: An Analytical and Graphical Treatment for Students and Engineers." The work was well received, and was immediately adopted as a text-book in many technical schools; a second edition was brought out early in 1893. Dr. Bedell is continuing his scientific work at Cornell.

BELL, Alexander Graham, was born at Edinburgh, Scotland, March 3, 1847.

Prof. Bell's father and grandfather were both teachers of languages, &c.; and his father early gave him instruction in the anatomy of the vocal organs, their various functions, and the different subjects belonging generally to the science of vocal physiology. When quite a child, A. G. Bell was told by his father of an automaton speaking-machine he had seen; and the boy was so interested that he determined to attempt the construction of such an apparatus himself, and he then and there invented a speaking-machine, built it, and made it articulate one or two simple words. While at Elgin, in Scotland, he found out for himself, also, that the elements of speech were compound in their nature, and became interested in the important work done by Helmholtz, relating to the quality of vocal sounds. In 1865, the family removed from Scotland to London; and about 1866, at Bath, in England, he conceived the idea of following up Helmholtz's synthetical experiments in the reproduction of sound, by attempting to transmit speech electrically. Between the years 1867 and 1870, he made numerous electrical inventions based on the Helmholtz vowel apparatus, and, before he left England, had resolved to pursue one of these inventions, that of harmonic or multiple telegraphy, to a practical outcome. The idea of actual speech-transmission was running in his mind all this time, like an undercurrent of thought that he could hardly formulate in definite expression; but it gradually took clearer shape, and Mr. Bell has stated on the witness stand that to friends in England, before 1870, he avowed his belief that we should "one day speak by telegraph." In August, 1870, the Bell family emigrated from England to Brantford, Canada; and in April, 1871, A. G. Bell went thence to Boston, on the invitation of the Boston School Board, to carry on a series of experiments with his father's system of "visible speech, or physiological symbols for the deaf." He remained permanently in the neighbourhood of Boston, from October 1, 1872, until his removal to Washington, in 1881. From the very moment of his arrival in Canada, in 1870, up to the beginning of 1874, his mind was full of the

Digitized by Google

scheme for the multiple transmission of telegraphic messages by means of musical tones, and he had other telegraphic inventions also in hand; but the old idea of speech-transmission was persistent in claiming his attention, and gradually his thoughts and energies were narrowed down to this one field of investigation. He has himself narrated more than once the manner in which he proceeded, stage by stage, from his experiments with phonautographic apparatus, human ear-drums, and apparatus for obtaining undulatory currents, up to the period when he and his assistant, Mr. T. A. Watson, were able to talk to each other telephonically over a short line in the Boston University, and when by rapid strides the crude apparatus was improved and brought up to a fair degree of efficiency. The first tests with the telephone as a speech-transmitter were watched with great interest by many scientific men, to whom Bell communicated his results freely, and from whom he received many valuable suggestions; but the press and public were sceptical in regard to the reports that began to circulate. Bell's first public lecture on the telephone was delivered before the Society of Arts, Boston, May 25, 1876; but the first time that speech was transmitted over a real line was August, 1876, at Brantford. He hastened to patent his invention, and the same year exhibited it at the Philadelphia Centennial Exposition, where a memorable display of its speaking powers was made on June 25, 1876, before Sir W. Thomson, the Emperor of Brazil, and others. Prof. Bell has taken out a great many United States patents, as sole or joint inventor, the most important being, of course, the one on which is based the speaking telephone of to-day. The photophone, however, upon which he has worked, stands high also as a scientific achievement. Being decreed the French Volta prize, he devoted the money to the establishment, in Washington, of the Volta Laboratory, with a view to original investigation in the transmission and reproduction of articulate sounds; and the Association, as it was called, formed at that place included Mr. Chichester A. Bell and Mr. Sumner Tainter. Several inventions have been the result of the labours of the Association, principally the jet telephone and the graphophone. Prof. Bell has also, to some extent given attention to devising improved methods of electrical communication between vessels at sea. Of late years, however, Prof. Bell has mainly devoted himself to his original pursuit, namely, the study of the deaf and dumb, in connection with his father's visible speech; and he has given much thought, with no small measure of success, to the amelioration of the condition of such unfortunates. Immediately after the invention of the telephone and its going into commercial use, Prof. Bell was called upon for Papers and lectures, and for a time he yielded to the demand. Among the most noteworthy of his productions are: "Researches in Electric Telephony," a Paper read before the Society of Telegraph-Engineers, October 31, 1877; "The Production and Reproduction of Sound by Light," a Paper read before the American Association for the Advancement of Science, August 27, 1880, relating to discoveries made by himself and Mr. Sumner Tainter in the art of "Radiophony;" and "The Production of Sound by Radiant Energy," a Paper read before the National Academy of Sciences, April 21, 1881, relating to further investigations of the same nature.

BENESCH, Charles, Jur. Doctor.

Dr. Benesch was born at St. Polten in Lower Austria, educated in the celebrated gymnasiums of the Benedictine convents of Seitenstetten and Melk-on-the Danube, studied law at the Vienna University, and passed in 1873 his examination as doctor of law with honours. Dr. Benesch also served as an officer in the campaign in Bosnia and the Herzegovina, and received the war medal. He at first practised at the Imperial Royal Commercial Court, but in 1874 he entered the service of the I.R. Post Office in the capacity of an administrative official. In 1877 he was ordered on duty to the Ministry of Commerce, and was eventually taken into their permanent service in 1879. There his duties were specially connected at first with the International Postal Telegraph Department, and afterwards with International Telegraph matters. In 1883 he was appointed a vice-secretary in the Ministry of Commerce, and in 1885 was member of the Austrian Delegation at the International Telegraph Conference at Berlin, in the capacity of a *fonctionnaire attaché*. There he first occupied his attention with telephone matters, and on his return worked out the Ordinance for State telephones, mostly on a basis of his own, involving ideas quite new and startling. This work was made into law, with very few alterations, by Ministerial decree of October 7, 1887, and is the basis of the Austrian State telephone system, which does not interfere with the private companies, over which the State has reserves and exercises strict control. For his services in this direction Dr. Benesch was appointed secretary in the Ministry of Commerce, and he may be looked upon as the creator of the present system of State telephony in Austria. Dr. Benesch was one of the Austrian delegates to the Paris International Telegraph Conference of 1890. In 1891 he was charged with the direction of the Ministerial Department for international telegraph matters and telegraph tariffs, and in the following year was appointed Section Councillor in the Ministry of Commerce.

BENNETT, Alfred Rosling, M.I.E.E.

Born in London, March 14, 1850. Educated principally at Belle Vue Academy, Greenwich.

Mr. Bennett went to India in 1869 in the service of the Indian Government Telegraph Department. Spent four years in India, Beloochistan, Persia, and Turkey. Obtained "special mention" certificate from the Indian Government for proficiency in submarine cable and land-line testing. Returned to England in 1873, and became electrician to the Highton Batteries Company, Limited, then working the battery and other patents of the late Rev.

Digitized by Google

Henry Highton, M.A. Had considerable practical experience of chemistry here, and assisted Mr. Highton in his endeavours to adapt his gold-leaf telegraphic instrument to signalling through long submarine cables. Retired from the Highton Batteries Company in December, 1874. Was afterwards electrician to the Magneto Company, Limited, for a short period. In 1875 read a Paper on "New Forms of Voltaic Batteries" before the Society of Telegraph-Engineers, in which was detailed a lengthened series of voltaic experiments with the caustic alkalis as exciting chemicals. These experiments ultimately resulted in the invention of the Bennett "tin-pot" battery, patented in 1881. From 1875 to 1880 was engaged chiefly in literary pursuits. Contributed largely to London and provincial journals, and was for some time editor of two London periodicals. In 1877 carried out the exhibition of Mr. Cromwell F. Varley's musical telephone at the Queen's Theatre, Long-acre, which was joined, for the purpose, to the Canterbury Music Hall by two overhouse wires—the first telephone wires ever erected in this country. In May, 1880, accepted an appointment from the United Telephone Company, Limited, as engineering superintendent of their East London District. In January, 1881, went to Glasgow as engineer to Messrs. D. and G. Graham, the proprietors of the Glasgow Commercial Telephone Exchange system. The same year patented and read a Paper on the subject of his "tin-pot" battery before the Philosophical Society of Glasgow. The battery was fully described at the time in *The Electrician*, and has since come into extensive use for telephonic and other purposes. Mr. Bennett also had charge of the first three or four installations of the incandescent lamp in Scotland (1881), and the first coal mine ever lit by electricity (Earnock, near Hamilton, August, 1881), was fitted up under his supervision. For this mine Mr. Bennett designed air-tight safety switches, and variable resistances for regulating the brightness of each lamp. In 1881 patented his telephonic translator (*Electrician*, Jan. 13, 1883), which had been invented the previous year, and which has since been adopted by all telephone companies possessing inter-town trunk lines. The translator was first put into practical use on the iron metallic circuit trunk lines between Glasgow, Paisley, and Greenock erected by the Post Office for the National Telephone Company, and which, after paying for, that company found useless on their hands until Mr. Bennett came to their assistance. In 1882 he invented his well-known corrugated terminal insulator (*Electrician*, Feb. 17, 1883), with which he commenced a crusade against double shackles, then in universal use for over-house telephone work, and which has recently ended in their total abolition. As a result of seeing M. Lazare Weiller's exhibit of bronze wire at the Palais d'Industrie in 1881, Mr. Bennett brought some to this country, and erected in Glasgow the first light telephone wires, February, 1882. The experiment was successful, and soon resulted in the disuse of the heavy iron and steel wires previously employed. In April, 1883, Mr. Bennett joined the old National Telephone Company as engineer for Scotland and Ireland, but after a few months was promoted to be General Manager for Scotland, Cumberland, and Westmoreland, an appointment he held until October, 1890, when differences of opinion with the newly-constituted Board of the amalgamated National Telephone Company led to his resignation. During Mr. Bennett's long connection with the National Telephone Company he completely revolutionised their methods of work, introducing everywhere light wire and the system of over-house construction which has since become almost universal in the United Kingdom. Under Mr. Bennett's management telephony attained a more advanced state of development in Scotland and Cumberland than in any other part of the country, villages of only a few hundred inhabitants supporting exchanges and enjoying trunk line communication before many towns of 40,000 and 50,000 inhabitants further south possessed any telephonic facilities whatever. The first copper metallic circuit inter-town trunk lines were erected in Scotland in 1884. In erecting the first of these, the Dundee-Arbroath, Mr. Bennett introduced the "cross" system of neutralising induction, which was found entirely satisfactory. In Scotland, too, the first public telephone call offices were opened. In connection with these Mr. Bennett invented his method of checking payments by means of adhesive stamps of values ranging from one penny to one shilling, for which stamps he prepared the designs. Mr. Bennett was the originator of the Edinburgh International Electrical and Engineering Exhibition of 1890, and in connection with it was a vice-chairman of the Executive Council; joint convener of the Electrical and Lighting Committee, and member of the Engineering Committee. In the last capacity he conceived and carried out the magnificent display of historical and modern locomotive engines which was a feature of the Exhibition. On leaving the National Telephone Company, Mr. Bennett was offered and accepted the general managership of the recently-formed Mutual Telephone Company, Limited, a position he retained until the purchase of the Mutual Company's business by the New Telephone Company, Limited, in March, 1892, when he became general manager and chief engineer to the latter Company. Mr. Bennett is the author of numerous pamphlets, articles, and papers on technical subjects, contributed to various scientific societies. He contributed Papers to the British Association at Cardiff in 1891, on "An Electrical Parcel Exchange" and "The Telephoning of Great Cities."

BERLINER, Emile. Born at Hanover, 1851.

In May, 1870, Emile Berliner emigrated to the United States, where his experiences were of a very varied character. In 1874 a friendly German apothecary in New York presented him with an old edition of Müller's "Physik" (1856), and from that he learned the rudiments of science. Soon after he stumbled across Paul La Cour's researches in phonic wheels, and this drew his attention to the possibility of transmitting speech by telegraph

Digitized by Google

wire. His first notion was to connect two vessels filled with mercury by a wire and pass a current through. Talking to one mercury surface, he reasoned, should vibrate the current and emit the sound at the other vessel. Lippman's capillary telephone nearly realised this conception. Returning to Washington in 1876 with the fever of research upon him, he began electrical experiments, and, for the purpose of learning something of practical work, paid frequent visits to the Fire Alarm headquarters. Berliner had just begun making diaphragms and contacts, and had looked up Bell's patent of 1876, when one day Mr. Richards, an operator, showed him, at his request, how to manipulate a telegraph key *à la* Catlin. "You have to press down harder," said Richards, "otherwise it may happen that the sounder at the other end will not respond well." Berliner immediately wanted a thorough explanation of the phenomenon, and it flashed upon him that if pressure made a difference in an electrical contact and modified the current, a vibratory contact would transmit speech by means of undulatory currents. He set to work to study the subject, and tried to transmit speech, using for receiver an apparatus as shown in the Bell patent of 1876. For a transmitter he used metallic diaphragms, touching screws tipped with either platina, steel, or broken lead-pencil points. Following up these researches, Berliner, finding that distance would weaken the effect very considerably, hit upon the idea of placing the transmitter in the primary of an induction coil, and he received the U.S. patent for this idea. In 1878 Berliner became a member of the electrical staff of the Bell Telephone Company. During the next few years his time was occupied with experimenting for the Bell Company, and in watching the manufacture of their instruments in Boston. In 1881 he paid a visit to Europe, and laid the foundation for a telephone factory in Hanover (now J. Berliner's), which has since introduced one of the modifications he invented—the so-called "Universal Transmitter," which can be used under all conditions with like superiority, and is exclusively used by the Austro-Hungarian Government, and in other countries. The Buda-Pest-Vienna-Prague line, 500 miles long, is fitted up with 50 of these instruments. Returning to the United States, Berliner moved to Cambridge, Mass., where he made the first studies which led on later to the gramophone. Touching the theory of the microphonic action of loose contacts, Berliner long ago held that it is the layer of air or gas between loose contacts which, acting as a variable resistance on increasing or decreasing thickness, produces the undulations; and that carbon is such an excellent material for a transmitter, because it has the property of condensing a cushion of air upon its surface. A notable "interference" in the United States Patent Office between Berliner, Edison, and others, about the priority of invention of the loose contact transmitting principle, resulted in a complete victory for Berliner, who received broad letters patent therefor. Among Berliner's other inventions of interest to electricians are his molecularium and his secondary battery. The former is an instrument of very simple principle, to illustrate the effect of the electric current by means of a single mechanical movement—that, namely, of the rotatory vibration of molecules. In his storage battery 5 per cent. of alcohol is added to a Planté type of cell, with the result that fresh lead plates form in a few minutes. Berliner has also brought out a superior spongy carbon, obtained by heating ordinary battery carbon to redness for several minutes in an open fire. This burns out the lighter hydrocarbons, leaving a spongy or capillary structure which increases the power to depolarise and decreases the resistance. In such a spongy carbon the gases will themselves give rise to currents if a piece of unburned carbon be used as the other electrode. Berliner was also the first (1877) to discover that an electric contact connected to a membrane would act as a reproducing telephone instead of a Bell instrument. Of inventions not electrical Berliner's chief effort has been the gramophone, which he has only lately perfected, although experimental toy machines have been sold during the past year or two in Great Britain and Germany. In the gramophone a zinc disc is covered with a highly-sensitive etching ground, into which phonautographic sound records are traced spirally. The disc is then immersed for fifteen minutes in chromic acid, which etches the sound records into the zinc. From this original record copies can readily be made by impressing electrotyped matrices into celluloid or hard rubber. In the reproducer the spiral groove, while vibrating a very stiff sounding spring, which is connected to a diaphram, also guides the stylus from periphery to centre. A detailed account of this machine appears in the *Journal* of the Franklin Institute for June, 1888.

BIDWELL, Shelford, M.A., LL.B., F.R.S., M.I.E.E., Barrister-at-Law. Born at Thetford, Norfolk, March 6, 1848; educated at Caius College, Cambridge; graduated B.A. (mathematical honours) in 1870; LL.B. (honours in law), 1871; M.A. in 1873. Also obtained a first class in the Special Examinations in Applied Science for the Ordinary Degree, in December, 1869.

Mr. Shelford Bidwell is the author of numerous papers describing investigation in matters relating to electricity and magnetism, which have been published in the *Proceedings* of the Royal and Physical Societies, the *Journal* of the Society of Telegraph-Engineers, the *Philosophical Magazine*, and other scientific periodicals. He has also delivered many lectures, chiefly upon subjects connected with electricity, at the Royal and London Institutions and elsewhere. Mr. Bidwell was a member of the Jury of the International Exhibition of Electricity held in Paris in 1881; member of the Council of the Physical Society, 1882-4, and of the Council of the Society of Telegraph-Engineers, 1883. He was elected a vice-president of the Physical Society in 1885, a Fellow of the Royal Society in 1886, and a Manager of the Royal

GUSTAV BINSWANGER.

Digitized by Google

Institution in 1892. He is a Director of the Edison and Swan United Electric Light Company.

BINSWANGER, Gustav. Born in Bavaria in 1855. Educated at the Polytechnikum, Augsburg.

Mr. Binswanger has resided in England since 1873, becoming naturalised in 1879, when he began business as an electrical engineer and manufacturer of electrical apparatus. The factories and business establishments he has conducted since that period have experienced a rapid growth and extension in keeping with the increase of electric lighting and telephonic business in general. To Mr. Binswanger's efforts and business and technical capacity are due a number of improvements in the use of electricity for lighting, motive power, cooking, and heating. We will mention only his early introduction of electricity meters, his improvements of electric fittings such as switches, ceiling roses, connectors, &c., his introduction of electric motors for domestic purposes, and his system of electric cooking and heating. Mr. Binswanger's attention was also given at an early date to telephony and electric signalling, and the position which his house holds in this branch of applied electricity testifies to the success which has attended his efforts. Mr. Binswanger is principal proprietor and Managing Director of the General Electric Company, a member of the Institution of Electrical Engineers, Fellow of the Society of Arts, and is on the Council of the London Chamber of Commerce.

BLÁTHY, Otto Titus, was born in 1860 in Totis, a small provincial town in Hungary.

He attended the Realschule and Polytechnicum at Vienna, and graduated there as mechanical engineer in 1881. The next two years he was engaged as draughtsman in the works of the Hungarian State Railways at Budapest, and in 1883 entered the electrical department of Messrs. Ganz and Co. at Budapest, as mechanical and electrical engineer, Since 1885 he has been principally engaged in developing the dynamos and the transformer system used by that firm, as also in designing alternate-current motors, meters, and other accessories. He has made also a special study of the steam engines and water motors best adapted for working electrical supply works. The chess world knows him as one of the most original problem composers living.

BLONDEL, André E. Born in Burgundy, France, 1863.

Received his first scientific education at Dijon; was admitted in 1883 in the Ecole Polytechnique, of Paris, and afterwards as a State Scholar in the Ecole des Ponts et Chaussées. During the same time he graduated Licencié of Mathematical and of Physical Sciences at the University of Paris. After a successful competition, where he obtained No. 1 of the list, he was appointed in 1888 Ingénieur des Ponts et Chaussées (State Engineer for Public Works). In 1887 he was appointed to the Central Light-house Service, where he pursued various experiments on electric lighting. Though gravely and continuously ill since that time, he contributed many Papers on electrical subjects, chiefly on alternating currents and arc light. In 1893 he lectured on electricity at the French National School of Mines, as a substitute to Prof. Potier; he was some months later selected as the first occupant of the Chair of Applied Electricity in the Ecole Nationale des Ponts et Chaussées, of Paris.

BLONDLOT, René Prosper, Doctor of Science. Born at Nancy, 1849.

From 1875 to 1882 Dr. Blondlot was demonstrator at the Physical Research Laboratory at the Sorbonne, and is at the present moment Professor of Physics at the Nancy Faculté des Sciences. He is the author of numerous memoirs on various physical subjects and of two text-books—one on thermo-dynamics, and the other on electrostatics. He has recently succeeded in proving experimentally that the speed of propagation of electrical waves is the same as that of light waves. He is the inventor of an electricity meter which received a premium in the Paris Municipal Meter Competition of 1889.

BOTTOMLEY, James Thomson, M.A., D.Sc., F.R.S., F.R.S.E., F.C.S. Born at Fortbreda, co. Down, Ireland, Jan. 10, 1845; educated at private schools, Queen's College, Belfast, and Trinity College, Dublin.

After taking the degree of B.A., with first honours and gold medal in Chemistry and Natural Philosophy, Queen's University, 1866, Mr. Bottomley was appointed Senior Scholar at Queen's College, Belfast; and assisted Dr. Andrews, the Professor of Chemistry, in his classical research on the continuity of the liquid and gaseous states of matter. Took degree of B.A. in Trinity College, Dublin, and M.A. degree, Queen's University, in 1867, with first honours in Chemistry and Natural Philosophy, and gold medals. Became assistant to the late Dr. W. A. Miller, Professor of Chemistry, King's College, London, 1868. Was transferred to be Demonstrator in Natural Philosophy in King's College, London, 1869. Became Lecturer on Natural Philosophy in the University of Glasgow at the commencement of Session 1869-70. Is Doctor of Science of the Royal University of Ireland, Fellow of the Royal Society, of the Chemical Society, and of the Royal Society of Edinburgh, Member of the Institution of Electrical Engineers, of the Physical Society, and others. Author of works on Dynamics, Hydrostatics, and Four-Figure Trigonometrical and Mathematical Tables. Dr. Bottomley also wrote an "Essay on the Progress of Science since 1833" (Conversations-Lexicon); all the articles on "Electricity and Magnetism" in Moxon's Dictionary of Science; also many scientific articles describing his own experimental researches, including "Thermal Conductivity of Water," "Permanent Temperature of Conductors," and a number of valuable Papers on "Thermal Radiation in Absolute Measure," communicated at intervals during the last seven years to the Royal Society, &c., &c.

BOYS, Charles Vernon.

Mr. Vernon Boys is the youngest son of the Rev. Charles Boys, of Wing, Rutland. He was educated at Marlborough College and the Royal School of Mines. After acting for a time as assistant to the late Dr. Guthrie, he was in 1881 appointed Demonstrator, and in 1889 Assistant Professor, of Physics at the Normal School of Science and Royal School of Mines, now called the Royal College of Science, South Kensington. He was elected a Fellow of the Royal Society in 1888, and in 1889, after serving on a jury in the Paris International Exhibition, was nominated to the distinction of "Officier de l'Instruction Publique." He is the author of several Papers published by the Royal Society, the Physical Society, the Royal Institution, and the Society of Arts, of which those of most interest to electricians are on "Integrating Machines," on "Quartz Fibres," on the "Radio-Micrometer," and on "Electric Oscillations." Mr. Boys is the author, also, of the supplement to Dr. Guthrie's "Electricity and Magnetism," and of "Soap Bubbles and the Forces which Mould Them."

BRIGHT, Charles, F.R.A.S., F.R.G.S., Assoc. M. Inst. C.E., M.I.E.E. Born at Lancaster Gate, London, in 1863. Educated at Lancing College, and at King's College, London, under Prof. Grylls Adams, F.R.S.

In 1881, Mr. Bright became a pupil of his father, the late Sir Charles Tilston Bright, C.E., M.P., whom he assisted at the Paris Exhibition of that year, at which Sir Charles was a Commissioner appointed by the Government for Great Britain. In 1882, Mr. Bright went out on a cable-laying expedition, which had for its object the laying of 3,500 miles of submarine cable in the Pacific Ocean, between Peru and Mexico, for the Central and South American Telegraph Company, touching at Panama and other intermediate points; during the latter part of the laying of which he was ashore on the coast of Mexico, for the testing of the cable and communication with the ship during laying. Mr. Bright has since been engaged continuously for the last 12 years, both on the engineering and electrical staffs of the India Rubber, Gutta Percha and Telegraph Works Company, in the construction, testing, laying, and repairing of various submarine cables, as well as in land line work, and in various preliminary surveying and sounding expeditions. He was engaged on the Spanish National Telegraph Company's cable expedition in 1884 for connecting up telegraphically Spain with the Canary Islands. In 1885, he was engaged on the laying of cables for the extension of the same system between the Canary Islands and Senegal by 1,000 miles of cable, and a year later on the West African Telegraph Company's cables of 4,000 miles down the West Coast of Africa to the Cape of Good Hope. Mr. Bright has also been engaged in the repairs of cables in the West Indies and elsewhere. In some of these expeditions he has had charge of the electrical operations aboard as well as ashore, and has also been in charge of the electrical testing work of the Submarine Department at the Silvertown Works. Mr. Bright has taken prominent part in many of the discussions arising on papers read before the Institution of Electrical Engineers, of which he is a Member; and has also contributed papers and articles to the electrical journals and to electrical handbooks. He became a student of the Institution of Civil Engineers in 1882 (and was on the committee of that class of the Institution), and became an Associate-Member of that Institution in 1889. Mr. Bright is also a Fellow of the Royal Astronomical Society and the Royal Geographical Society. He holds a commission as Captain in H.M. Militia, and has also taken a prominent position in the athletic world.

BROWN, Charles Eugen Lancelot.

Born in Winterthur, Switzerland, June 17, 1863.

Mr. Brown was educated at the Gymnasium and the Technical School at Winterthur. After serving a one year's apprenticeship in Mr. Bürgin's establishment, in Basle, he organised a small electrical department at the Schweizerische Locomotiv- und Maschinen-fabrik at Winterthur. In 1884 he was engaged by the Oerlikon Company, and within two years thereafter became Director of the electrical department of this well-known firm. His name first became known to the public through his connection with the Solothurn-Kriegstetten electric transmission of power in Switzerland, when he was barely 23 years of age, by which installation he proved that electric transmission of power was practically possible, and which was the cause of a great number of such utilisations of hydraulic power at great distances. At the Paris International Exhibition in 1889 the only grand prix awarded to dynamos was won by his machines. Among some of the works in which he has more recently been engaged, may be mentioned the transmission of power at Cassel, where by means of single-phase alternating currents he transmitted 200 H.P. over 6 kilometres. His work in big low-tension dynamos for production of aluminium has been especially successful, and dynamos up to 600 H.P. are actually at work. His studies in this direction led him to the construction of unipolar machines and to the design of a dynamo of this type actually giving 3,000 amperes at 10 volts, which can be considered as the first really practical unipolar dynamo. More recently he has worked at the high-tension line, and he first called attention to the fact that it is possible to produce and transmit high-tension currents of 20,000 volts or more over long distances by naked wires on suitable insulators, the outcome of which was the now renowned Frankfort-Lauffen transmission. Mr. Brown has also been actively engaged in developing the multiphase system; a 300-H.P. three-phaser and transformer of the same capacity, and a non-synchronous motor with no sliding contacts, are already well-known. In 1891 he left the Oerlikon Works, and established himself at Baden, carrying on the manufacture of electrical machinery. In 1891-92 he devoted himself to the development of practical single-phase alternate-current motors,

Digitized by Google

and large numbers of his machines are now in use. In the early part of 1893 what is probably the slowest-running dynamo in the world was constructed at his works: it is for 100 H.P. at 30 revolutions, and is coupled direct to a turbine shaft.

BRUCE, Eric Stuart, M.A. (Oxon), Fellow of the Royal Meteorological Society, Member of the Society of Arts, and Member of the Aeronautical Society of Great Britain. Is the only son of the late General Michael Bruce, who commanded the Grenadier Guards. He was born August 20, 1855, and educated at Radley College and at Exeter College, Oxford.

Mr. Bruce commenced lecturing on scientific matters while still an undergraduate, and after taking his degree he appeared at the Steinway Hall, London, lecturing on the "Electric Light" with such success that, immediately afterwards, in February, 1883, he took the Egyptian Hall for six weeks for a series of lectures on electricity. This was followed by various provincial lecture tours. In 1885 he brought out the "Electrical Translucent Bruce Balloon," for flashing signals by night by electricity. This was exhibited in model in the War Department of the Inventions Exhibition, and exhibited nightly at the Albert Palace, Battersea, for a month. At this time Mr. Bruce was lecturing at the Albert Palace on balloon signalling, and giving a series of afternoon lectures on "Science and War," at the Crystal Palace. In October, 1885, at the invitation of the Secretary of State for War, Mr. Bruce carried on a series of balloon signalling experiments before a Committee of Royal Engineers at Chatham. The report made was so favourable that he immediately received orders to supply some balloon signalling apparatus to the Royal Engineers; and in the following January, 1886, a second successful trial took place at Aldershot at the Army Signalling School, under the superintendence of Major Thrupp. The invention is patented in all principal countries. In January, 1887, Mr. Bruce lectured on "War and Ballooning" at the London Institution, and conducted another lecture tour in the provinces. In April, 1887, he lectured at the Princes' Hall, Piccadilly, on "Science and the Jubilee." In September, 1887, he received an order for apparatus from the Belgian Government, then about to adopt his system. In the same month, at the invitation of the Roumanian War Minister, Mr. Bruce conducted a series of successful experiments at Lillie Bridge Grounds, before a delegate sent purposely to London by the Roumanian Government to report on the system, with a view to its adoption in that country. Mr. Bruce has quite recently been to Antwerp, by the invitation of the Belgian War Minister, to conduct some balloon experiments before the Royal Engineers. These experiments took place under the presidency of General Wouvermans, the Inspector-General of Fortifications at Antwerp. Delegates from Holland, Italy, France, and Russia were sent to Antwerp to witness these experiments, and the Belgian Government has now adopted the Bruce system of balloon signalling. In May, 1889, Mr. Bruce exhibited, by request, at the *conversazione* of the Royal Society, his new optical invention, the electro-graphoscope, for showing dissolving views without a screen. This invention has been worked out on a large scale and was exhibited under the title of the aerial graphoscope during the autumn of 1891 at the Photographic Society's Exhibition in Pall Mall. In February, 1890, Mr. Bruce read a paper before the Royal Meteorological Society on "An Optical Feature of the Lightning Flash." In 1891 he conducted several extensive lecture tours, and amongst his lectures in the Metropolis was one on "Fogs and their Prevention," written at the request of the Sunday Lecture Society, delivered at St. George's Hall. In March, 1892, Mr. Bruce read a Paper before the Physical Society on the aerial graphoscope, and in the summer of that year conducted experiments at the Stamford Bridge Grounds with his latest improvements in electric balloon signalling before General Prince Edward of Saxe-Weimar and other military and naval authorities. He also took part with his electric balloon in the Military Tournament in Cork. In January, 1893, Mr. Bruce read a paper on "Electric Balloon Signalling" at the Royal United Service Institution, Gen. Sir G. W. A Higginson, K.C.B., late Lieutenant of the Tower of London, being in the chair. In the following June he read a paper before the Aeronautical Society of Great Britain on "The Working of Captive Balloons in Windy Weather."

BUMSTED, F. D., J.P., M.I.M.E. Born in 1847. Educated at King's College School and afterwards in the College, and was for five years in the workshops of the College.

In 1870 Mr. Bumsted went to the great engineering works of John Elder and Co., Glasgow (now the Fairfield Shipbuilding and Engineering Company), where part of his apprenticeship was served. In 1874 he built the Cannock Chase Foundry and Engine Works (now Messrs. Bumsted and Chandler), which have yearly increased in magnitude since that date. Mr. Bumsted is the inventor of the world-renowned machinery for the manufacture of paper bags. In 1885, in the early days of house lighting by electricity, Mr. Bumsted personally superintended the lighting of his house with 30 E.P.S. cells, the whole installation having worked highly satisfactorily ever since. In the beginning of 1888 Mr. Bumsted was called to the magisterial bench.

CAPITO, Charles, C.E., M.I.M.E., M.I.E.E. Born in Copenhagen and educated in the same city.

After serving his apprenticeship as a mechanical engineer, Mr. Capito studied for several years at the University of Copenhagen and there took his degree as "Master of Engineering." In 1877 Mr. Capito was appointed chief engineer to the Kryolite Mining and Trading Company of Copenhagen, and subsequently went to the Company's mines at Ivigtut in Greenland. In 1880, however, he came to England, and was soon afterwards engaged in the City and Guilds of London Institute as

Digitized by Google

assistant to Prof. Ayrton, F.R.S., and from this time his career as an electrical engineer may be said to have commenced. In 1882 Mr. Capito was appointed chief electrical engineer to the Electrical Power Storage Company (Limited). In this position he was responsible for all experimental work as well as for the manufacturing of the E.P.S. cells. He also represented the Company as an expert in the United States, Berlin, and Vienna during the negotiations for the sale of the Company's patents. In 1884, Mr. Capito went into business as a consulting engineer, in addition to which he joined the late Hanover-square School of Electrical Engineering as Senior Instructor. On the closing of the latter school in February, 1893 he was offered charge of the Engineering Instruction at the Electrical and General Engineering College, Penywern House, Earl's Court.

CARDEW, Philip, Major Royal Engineers. Born Sept. 24, 1851. Took honours at R.M. Academy at Woolwich in 1868, and in 1871 obtained a commission in the Royal Engineers, being at the same time awarded the Pollock gold medal as the most distinguished cadet of the season.

Placed in charge of the Military Telegraphs at Bermuda in 1876, Major Cardew in 1877 joined the Submarine Mining Service, and a year later was appointed Assistant Instructor, and in 1883 Instructor in Electricity at Chatham. As an inventor, Major Cardew has contributed not a little to the advancement of science. Among the principal of his inventions are a cheap and easily replaceable form of projector for the electric search light used in the military and naval services; a system of dynamo winding; a voltmeter, applicable to both continuous and alternating currents, for which a gold medal was awarded at the Inventions Exhibition of 1885; a method of measuring large currents and very small resistances; and a system of vibration telegraphy which has been used successfully in recent campaigns, and which forms the basis of the system of communicating with trains in motion now in use in the United States. Major Cardew is a member of the Institution of Electrical Engineers, and is Electrical Adviser to the Board of Trade.

CARHART, Prof. Henry S., M.A., LL.D. Born at Coeymans, Albany County, N.Y., March 27, 1844.

During the early years spent on his father's farm the district school furnished the principal means of intellectual growth within his reach, but sometimes a college man was employed as teacher, and this afforded an opportunity to study the university algebra and other subjects outside the ordinary range of instruction. At 19 young Carhart was at the head of a Quaker school a few miles from Poughkeepsie, teaching and earning means to complete his preparatory course at the Hudson River Institute at Claverack, and soon prepared in mathematics, largely by teaching the subject to pupils older than himself. In 1865 he was admitted to Yale College, but at the opening of the college year entered the Wesleyan University at Middletown, Connecticut, from which he graduated in 1869. He was employed for two years as teacher of Latin at Claverack, and then sought again the congenial atmosphere of college life. This time it was the Yale Divinity School; but during the year spent at Yale the advantages offered by the Sheffield Scientific School proved too strong to be resisted. The work in German, under Prof. Whitney, turned his thoughts and purposes towards the teacher's life and scientific pursuits, to which he has ever since been devoted. In 1872 Mr. Carhart accepted an appointment in the North-western University at Evanston, first as instructor, but the next year as Professor of Physics, which chair he continued to fill until appointed to the Professorship of Physics in the University of Michigan in 1886. In 1881, he spent a year abroad. He attended the Paris Exposition of Electricity as one of the International Jurors of Award for the United States, after which he took a course of study and experimental work in the Helmholtz laboratory at the University of Berlin. The result of his work here was the production of a standard cell for the measurement of electromotive force, which is now in use in the leading physical laboratories of the United States. The department of electrical engineering, recently established in the University of Michigan, over which Prof. Carhart now presides, has attracted students in large numbers, of three colleagues. As a member of the Committee on Physics Teaching of the American Association for the Advancement of Science, he joined with Prof. Mendenhall and others in a report on this subject, published in the proceedings of the Cleveland meeting in 1888. Prof. Carhart has been a frequent contributor to the leading scientific and technical journals, and has recently published a work on "Primary Batteries," which is well known in this country, and a book on "The Elements of Physics." Prof. Carhart was one of the official delegates to the recent International Electrical Congress in Chicago, and he was President of the Committee of Judges of Award in the department of Electricity for the World's Fair. In 1893 his *alma mater* conferred upon him the honorary degree of Doctor of Laws.

CHANDLER, Noel, M.I.M.E. Born at Epsom, Surrey, 1851; was educated at King's College School, and afterwards at the College, London, and studied for five years in the workshops of the College.

In 1870 Mr. Chandler went to the works of John Elder and Co., Glasgow (now the Fairfield Shipbuilding and Engineering Company), where a part of his apprenticeship was served. From there Mr. Chandler went to Messrs. Clayton and Shuttleworth's, of Lincoln, with the object of obtaining a varied experience. In 1874 he was engaged as manager of the Cannock Chase Foundry and Engine Works, which had just then been completed; and in 1890 he became a partner with Mr. F. D. Bumsted. He is the inventor and patentee of the well-known high-speed engine bearing his name, which is being largely adopted for electrical purposes. Mr.

RICHARD COLLETT.

Digitized by Google

Chandler is also the patentee of a very efficient fan, largely used on steamships for forced draught, and in coal mines for ventilation.

CLARK, Latimer, C.E., F.R.A.S., F.R.S., Past President of the Society of Telegraph-Engineers and Electricians. Born at Great Marlow, March 10, 1822.

At first connected with the chemical manufacturing industry, he commenced railway surveying in 1847, and was appointed assistant engineer for the construction of the Britannia Tubular Bridge across the Menai Strait, under his brother, Mr. Edwin Clark, the resident engineer. During his stay at Menai Bridge Mr. Latimer Clark used electricity to fire a time-gun every evening at 8 o'clock. The attention of the Chairman of the Electric Telegraph Company was, through this, called to the young engineer, who, in 1850, was appointed assistant-engineer to the company, under his brother, becoming afterwards their engineer-in-chief and consulting engineer. Many improvements in the telegraph system were introduced by him; and a very able report on the subject of underground telegraph wires was made by him in 1860, which was embodied later on in the Government report in 1861. He was the first to witness the retardation of electric signals by induction in submarine lines, and to demonstrate that currents of low tension travel as fast as those of high tension. In 1856 Mr. Clark invented and patented the double cup insulator for overland telegraph wires, now universally employed throughout the world. To him we owe the important invention, in 1854, of the pneumatic transmission of messages, now so largely used. The invention of a method of protecting submarine cables by Clark's compound followed in 1858. In 1860 he acted as a member of the committee appointed jointly by the Government and the Atlantic Cable Telegraph Company to inquire into the whole subject of submarine telegraph cables. Mr. Clark was also for many years engineer to the Indian Government cable lines in the Persian Gulf. As head of the firm of Clark, Forde and Co., he was connected with the submergence of some 50,000 miles of submarine cables in all parts of the globe. His determination of the effect of temperature on the insulation of gutta-percha cables, in connection with Sir Charles Bright, in 1863, proved highly valuable, and is still in daily use. He also, in connection with the same gentleman, originated, in 1861, the system of electrical measurement in ohms and volts which has now come into general use and has conferred such vast benefits on electrical science. He is also the inventor of the well-known Clark's standard cell. We may mention the publication by him, in 1868, of a Treatise on Electrical Measurement, and in 1871, in conjunction with Mr. Robert Sabine, of his electrical tables and formulæ for operations in submarine cables, besides other Papers of great value. Mr. Latimer Clark has taken out a large number of patents in different countries, many of his inventions being of great value. For a number of years a partner in the engineering firms of Clark and Standfield, and Latimer Clark, Muirhead and Co., he has brought out many important improvements in different branches of engineering. Mr. Clark is also the author of several astronomical works, and of a very valuable Dictionary of Metric and other Useful Measures. He is a Chevalier of the Légion d'Honneur.

COLLETT, Richard, M.I.E.E. Born at Fairford, Gloucestershire, in 1825. Educated at a private school, and subsequently by private tuition.

Mr. Collett entered the service of the Atlantic Telegraph Company in 1857, on the electrical staff, and was stationed in Ireland during the attempt to lay the Atlantic cable in that year. He assisted in the experiments made on the cable in the following winter at Devonport, and was on board Her Majesty's ship "Agamemnon" during her operations in 1858, including the laying of the cable. After communication with Newfoundland totally ceased he remained at Valencia, in charge of the station, until 1860, when the enterprise was for the time abandoned. In the same year he received an appointment from the Indian Government on the Rangoon and Singapore cable, as superintendent in charge at Singapore, but circumstances prevented the cable being laid. In 1861 he entered into an engagement with Messrs. Glass, Elliot, and Co. (afterwards the Telegraph Construction and Maintenance Company); assisted at the laying of the Malta and Alexandria cable; was in charge at Alexandria when the line opened for traffic; and afterwards acted as travelling superintendent of the above-named company until 1866, when he was appointed traffic manager jointly to the Atlantic Telegraph and the Anglo-American Telegraph Companies, and assisted on board the "Great Eastern" at the laying of the 1866 Atlantic cable. The management afterwards falling solely into the hands of the Anglo-American Telegraph Company, he continued to hold the same position until leaving the service in 1870. On the formation of the Brazilian Submarine Telegraph Company he was appointed secretary, and now holds that position. He was traffic manager of the first Atlantic cables opened to the public; is one of the original members of the Society of Telegraph-Engineers (now the Institution of Electrical Engineers); and received from the Emperor of Brazil the decoration of Knight Officer of the Order of the Rose.

COLOMBO, Giuseppe. Born in Milan in 1836; obtained diploma of Civil Engineer at the University of Pavia in 1856.

Signor Colombo applied himself to electric lighting in 1882, when he went to America to see Mr. Edison's installations. On his return he made the plans for the Electric Central Station of Milan, which now supplies 35,000 glow lamps and 1,000 arc lamps to that city. He was for some time the General Director of the Società Generale Italiana d'Elettricità, which works the Central Station of Milan, and has executed numerous installations of electric light throughout Italy. In 1890 he was appointed Minister of Finance in the Italian Government.

COTTERELL, Arthur Edgar. Born at Moseley, May 15, 1864; educated at the Birmingham and Edgbaston Proprietary School, subsequently under the private tuition of the late Prof. J. H. R. Bayley. He also attended the Mason Science College, at Birmingham.

In November, 1879, Mr. Cotterell entered the service of the Midland Telephone Company, Limited, in Birmingham. On the taking over of that Company by the National Telephone Company, Limited, his services were retained by the latter Company until his resignation in October, 1884. During the period of his engagement with the latter Company, Mr. Cotterell paid particular attention to the question of inductive disturbances, and carried on many and varied experiments with underground and overhead cables and systems. He also designed and invented several systems and exchange connections for general telephone work. He is an ardent supporter of overhead telephone and telegraph wires, and having been connected with telephony from its first appearance in Birmingham, is well known there. Among his more recent inventions may be mentioned a new form of telephonic call-box, to be used at the various call offices open for the use of subscribers and the public. By means of certain acoustic arrangements the operators at the Telephone Exchange are enabled to readily recognise the various coins paid in by the would-be user. Apertures are provided for subscribers' tokens, and, on the insertion of these, easily recognisable signals are transmitted, showing whether the person is entitled to use the trunk or local connections. He has also invented an apparatus for overcoming or minimising induction on telephone circuits. At the time of his resignation of the National Company, Mr. Cotterell had had for some time the superintendence of the whole electrical system, both in Birmingham and the Brierley Hill districts. In January, 1885, he joined his brother (Mr. C. W. Cotterell, surveyor) to practise as surveyors and electrical engineers. On the 10th October, 1885, he delivered a lecture on "The Development of Telephony" before a large meeting of the members of the South Staffordshire Institute of Iron and Steelworks Managers. In April, 1886, Mr. Cotterell accepted the appointment of Local Manager of the National Telephone Company, Limited, in the Potteries. In the June following he was appointed to the managership of one of the Company's largest centres, which comprises Birmingham, Wolverhampton, Wednesbury, and Walsall. Mr. Cotterell is the author of numerous articles and papers on various electrical and, particularly, telephonic matters, and has delivered many lectures on these subjects. Among these may be mentioned "Telephony Past and Present," "Disturbances on Telephone Circuits," "A Few Errant Notions on Telephone Matters," "The Development of Telephony," "Electricity—Terrestial, Celestial, and Up to Date," "Electrical Phenomena and Their Relation to Telephony," etc., etc. Mr. Cotterell now occupies the post of District Manager for the large area known as the Birmingham District.

COUR, Paul La. Born in Jutland, 1846.

M. Paul La Cour was educated at the University of Copenhagen. In 1872 he was Vice-Director of the Meteorological Institution in Copenhagen, but since 1878 he has been Professor at the High School in Askov (Jutland). For a treatise on the measurement of the height of clouds the Royal Danish Academy of Science awarded him a special silver medal in 1872. In 1874 he invented the phonotelegraph, and the same Academy awarded him a special gold medal. This system is described in the *Journal Télégraphique* of March 25, 1876. In 1876 M. La Cour invented the phonic wheel, an isochronous apparatus, the movement of which is regulated by an intermittent electric current. In 1877 he arranged a synchronism of two phonic wheels at different telegraphic stations, and in 1882 he improved the synchronising apparatus so that it was applicable to different kinds of telegraphy. In the same year he sold his American patent rights in connection with the phonic wheel. In 1888 M. La Cour devised spectro-telegraphy, a kind of optical telegraphy by which combinations of rays of different refrangibility are sent; and the signals are read through a spectroscopical telescope as Morse-letters, the size of which is independent of the distance. In 1891 he invented an astatic regulator, called the "Kratostat," which ensures absolutely steady running in steam engines, and also regulates the speed of wind and water motors, &c. M. La Cour has received several medals for his scientific labours.

COURTENAY, John Irving, is an M.A. of Trinity College, Oxford, and a Barrister-at-law of Lincoln's Inn.

Mr. Courtenay took an active part in the introduction of the electric light on a commercial scale into this country. In 1882 he associated himself especially with the development of the storage battery industry; and, as a Director and afterwards as Managing Director of the Electrical Power Storage Company, which then owned the secondary battery patents of Faure, Sellon, Swan, King and others, spent much time in representing in various European countries and in the United States of America the patent rights and interests of that Company. Mr. Courtenay is Chairman and Managing Director of the Electrical Power Storage Company, and Chairman of the Chelsea Electricity Supply Company, and of the United River Plate Telephone Company, and is well known in electrical circles as taking a very real interest in the development of the electrical industries.

COUSENS, R. Lewis, M.I.E.E. Born 1860; educated at St. Olave's Grammar School, Southwark, and subsequently by private tuition.

Mr. Cousens, in 1880, entered the School of Electrical Engineering and Submarine Telegraphy at Hanover-square, London, W., and in 1881 joined the Anglo-American Brush Electric Light Corporation, Limited, as electrician. In October he was transferred to Messrs. Hammond and Co. (afterwards the Hammond Electric Light Company), and assisted at several of their in-

Digitized by Google

stallations. From there he went to South Africa, and carried out installations for the (late) South African Brush Electric Light Company, at Port Elizabeth and at Kimberley. In 1884 the plant at Kimberley was sold to the Borough Council of that place, in whose service he entered as borough electrician. Besides carrying out the work of the public lighting of the town of Kimberley, he completed and superintended the maintenance of the incandescent lighting of the theatre and other buildings, also several large and important arc installations for the various diamond mining companies at the diamond fields. He resigned his position as borough electrician in 1889, and in the following year was offered and accepted the position of general manager and agent in South Africa for Woodhouse and Rawson United, Limited. He is engaged in carrying out installations for his firm in all parts of South Africa.

COWAN, Edward Woodrowe. Born 1861.

Mr. Cowan was educated at Kensington Grammar School, and in 1878 entered the firm of J. J. Thornycroft and Co., Church Wharf, Chiswick, torpedo boat builders, as an apprentice, and remained with them for six years, when he went for two years to Newcastle as draughtsman in the engine and hydraulic department of Sir William Armstrong, Mitchell, and Co. In 1886 he left them to assist in the design of the machinery of a torpedo boat which was being constructed by Messrs. Doxford and Sons, Sunderland, and later in the same year joined Mr. Arthur Rigg as his assistant in London, in the following year going to his works in Chester as assistant-manager. Mr. Cowan commenced the study of electrical science under Professor Wilson at the Birkbeck Institution while serving his apprenticeship at Messrs. Thornycroft's, and he subsequently taught the subject under the Science and Art Department. Under Mr. Rigg he first came in contact with electrical engineering, and in 1888 he, in conjunction with Mr. Fawcus, designed a central station for the supply of electricity in Chester; the Town Council, however, refusing to grant their consent to a Provisional Order to their Company, the work has not yet been carried out. In the same year they designed a central station for Keswick, utilising the water power of the River Greta; this work was completed early last year, and has since been enlarged to their plans. Early in 1892 Mr. Cowan undertook the management of the Manchester Edison-Swan Company's works, which position he now holds. Mr. Cowan is the joint author with Mr. Fawcus of two Papers published in the *Transactions* of the Institution of Civil Engineers. He is an Associate-Member of that Institution, and a Member of the Institution of Electrical Engineers.

COX-WALKER, E., M.I.E.E. Born at Stockton-on-Tees, in the year 1838, and principally educated at Holgate Commercial College, York.

Very early in life Mr. Cox-Walker's attention was turned to the subject of telegraphy, and at the age of 13½ years he entered the service of the Electric and International Telegraph Company at York as a junior operator. In 1877 he made his first telephone, from a description which appeared in one of the scientific papers, and from that time to the present he has been continuously engaged upon telephone, lighting, and general electric work. In February, 1878, he made, and provisionally patented, improvements on Bell's telephones, having for their object the increase of their sound by the union into one opening of two, four, eight, or more diaphragms; the use of two ear-tubes on one receiver, as now used for the Gower-Bell telephone, being also patented at the same time by him. In May, 1878, Mr. Cox-Walker exhibited his duplex, quadruplex, and octoplex telephones to the members of the Royal Institution; and has since delivered many lectures on the telephone, electric light, phonograph, and electrical appliances generally before literary, scientific, and other societies in the north of England. In 1878 Mr. Cox-Walker made the acquaintance of the late Rev. Henry Hunnings, then curate of Bolton Percy, and assisted him in his experiments. Between them they perfected the celebrated "Hunnings transmitter," which is acknowledged to be the best transmitter for all telephone work. During his experiments with Mr. Hunnings, Mr. Cox-Walker first made and used an electro-magnetic receiver in conjunction with the Hunnings transmitter. After a long series of trials and experiments he ultimately produced the instrument so well known as the "Cox-Walker receiver." Unfortunately, the United Telephone Company claimed that both the "Hunnings transmitter" and the "Cox-Walker receiver" were infringements of their rights as owners of the patents of Edison and Bell, and brought an action against the firm, which lasted a month in the Court of first instance and six days in the Court of Appeal. The style of the firm is now Cox-Walkers, and is carried on by Mr. Cox-Walker, assisted by his sons, and their business is rapidly extending all over this country and abroad. Large new premises have lately been erected by them for general manufacturing purposes in Feethams, Darlington.

Mr. Cox-Walker has, in addition to the above, made and carried out many useful improvements in electric signalling apparatus for mines, electric bells, magnets, motors, &c. One of his most ingenious and successful inventions is the watchman's tell-tale. This useful machine keeps a record of the movements of the night watchmen of a large building, or a town, or the warders of an asylum or prison, and has met with much commendation from the Commissioners in Lunacy, who are recommending it for adoption in all asylums. Besides the telephones known as above, Mr. Cox-Walker has invented several forms of receivers, some of which have proved very successful. Lately Mr. Cox-Walker's attention has been directed to electric lighting and power, and to the development of a system of bells, &c., for railway, mining, and domestic purposes, which can be worked by a patented form of magnetic generator.

CROCKER, Prof. Francis B. Born at New York, July 4, 1861 ; graduated at the School of Mines, Columbia College, in 1882, with the degree of E.M.

From 1882 to 1888 Mr. Crocker was associated with Charles G. Curtis, C.E., in the firm of Curtis and Crocker, electrical engineers. In 1886 Messrs. Curtis and Crocker invented the "C. and C." electric motor and battery, and established the "C. and C." Electric Motor Company. During 1888, Mr. Crocker, with Dr. Schuyler S. Wheeler, developed the Crocker-Wheeler electric motors and dynamos. When the course of Electrical Engineering was established at Columbia College, in 1889, Mr. Crocker was placed in charge of it as principal instructor, and he is now the Professor of Electrical Engineering. Prof. Crocker has been Vice-President of the American Institute of Electrical Engineers, and President of the New York Electrical Society. He was general secretary of the International Electrical Congress at Chicago in 1893. Prof. Crocker has contributed to electrical societies and journals a number of papers, which have been well received.

CROMPTON, Rookes Evelyn Bell. Born near Thirsk, in Yorkshire, 1845 ; educated at Elstree Hill School, Harrow School, and in Paris.

Mr. Crompton entered the Army and was appointed to the Rifle Brigade in 1863 ; served with his regiment in India until 1869 ; from 1867 to 1875 held an appointment under the Department of Public Works as engineer in charge of the Government steam train. In 1876 left the service and became a partner in the firm of T. H. P. Dennis and Co., of Chelmsford. A year later he became engineer-in-chief of the Stanton Ironworks Company. Shortly after the completion of the foundry, necessity for working continuously day and night led him to study the possibility of adopting the electric light, which at that date (1877), was a novelty in this country. Early in 1878 he commenced electrical engineering in a small way, supplying Gramme machines and Serrin lamps, and soon superseded these by Bürgin machines and arc lamps of his own invention. A considerable sale for arc lighting sets was soon obtained. At this time the only manufacturers of dynamo machines in England were Messrs. Siemens and Messrs. Wild, of Manchester. Several large railway stations were then lighted by him, and in 1881 the first large installation of incandescent lamps was carried out at the Royal Courts of Justice. About this time Mr. Crompton and Mr. Kapp, who was then his manager, brought out the well-known compound winding of dynamo machines. The first practical application of these machines was for the lighting of Berechurch Hall and for the Royal Courts of Justice. Since that time the Chelmsford works have rapidly developed, and are now among the largest in this country. Mr. Crompton at an early period saw that the great future of electrical engineering lies in the direction of central supply stations, and he therefore, in 1881, allied himself with the Edison-Swan Company and became their designing engineer for a central station situated close to Victoria Station. However, on account of the depression which followed the over-speculation in electric lighting shares in 1883-4, this central station was not carried further than to an extent sufficient to supply the London, Chatham, and Dover Railway Company's requirements. For some years capitalists would not find money for central station supply in England, but Mr. Crompton was fortunate enough to secure an order for a large central station at Vienna, which gave him opportunities of working out his ideas. He there commenced the system which has since been so largely adopted in England, *i.e.*, of dividing up central-station plant into a considerable number of units, as from the experiments he had made at Victoria Station he had discovered that the cause of the great difference which exists between the economical efficiency of plant at full load and its actual economical efficiency as shown by the weekly or monthly working expense accounts, is due to the want of economy of large steam engines and boilers when run for long hours only partially loaded. In order to avoid this loss at Vienna, he divided the 1,600 H.P. required for the station into eight sets of 200 H.P. each, each set being self-contained, direct-coupled Willans engines being employed. A large number of the special features which have since characterised English practice were successfully introduced in this Vienna station. Among these we may mention, in addition to the use of the Willans engines direct-coupled to Crompton dynamos, the use of the 5-wire system combined with accumulators, the use of large accumulator regulator switches having many contacts, the use of shunted Deprez-D'Arsonval galvanometers for accurately measuring the large currents used, the use of a vertical exhaust pipe placed centrally and extending nearly to the top of the chimney, ring main steam pipes, and various other devices which at that time were unknown, but are now universally used. The successful working of this Vienna station gave him confidence to start a similar central station in 1886 in London at Kensington, and the economical results and commercial success obtained from this station from the first month that it was set to work very largely contributed to restoring the confidence of investors in electric lighting supply companies, and which has resulted in their present development. Mr. Crompton has, throughout, been a steady believer in the merits of direct supply, thinking that up to the present date the problems connected with high-pressure alternating current supply and use of transformers have not been sufficiently worked out to make it satisfactory, either from an economical point of view or from that of trustworthiness and freedom from danger. He has from time to time read Papers before the Institution of Civil Engineers, the Institution of Electrical Engineers, and other scientific bodies, upholding these views ; and he considers that, up to the present date, the returns from the various English supply companies which have been a sufficient time at

WILLIAM CROOKES.

Digitized by Google

work, show that, whereas English electrical engineering, exemplified by the results obtained in the various low-pressure electric supply stations, shows to very great advantage compared with other countries, the results from the rival system still leave much to be desired. Mr. Crompton has never ceased to point out that the conditions of electric supply in England differ very widely from those in foreign countries. The habits of Englishmen are such that electric lighting is used to a far greater extent in private houses in this country than is the case on the Continent or in America. The English load diagrams are, therefore, of quite a different character to those found in foreign stations, the periods of maximum load being of a much shorter duration. In a Paper contributed to the Institution of Civil Engineers in 1891, he gave the name of "load factor" to the relation which the actual output of a plant of any given size bears to what would be its output if it were worked continuously day and night at the maximum observed load, and for the same period. He, since then, has continued to point out how much the economical efficiency and design of electric plant are affected by this question of load factor, and how important it is it should be studied before any particular system of plant is adopted. Mr. Crompton has also taken considerable share in the inventive work required in the development of systems of underground mains necessary for central supply stations, advocating the use of bare copper strained over porcelain insulators in concrete culverts. This system has been extensively adopted, and with satisfactory results. He has also interested himself in the question of electrical standards and in the production of electrical measuring instruments of high degrees of accuracy, particularly the potentiometer method, various forms of this instrument having been worked out by him personally. He is a member of the Institution of Civil Engineers and Vice-President of the Institution of Electrical Engineers. He took a considerable share in organising the Electrical Section of the London Chamber of Commerce, and was elected the first Chairman of that Section.

CROOKES, William, F.R.S., P.P.C.S., Past President of the Institution of Electrical Engineers. Born in London in 1832; entered Royal College of Chemistry in 1848 as a pupil of Dr. Hofmann, and gained the Ashburton Scholarship in 1849. In 1850 he became junior, then senior, assistant to Dr. Hofmann, which position he retained till 1854, when he obtained the appointment of Superintendent of the Meteorological Department of the Radcliffe College, Oxford. Elected a Fellow of the Royal Society in 1863.

Mr. Crookes founded the *Chemical News* in 1859, of which paper he is still the proprietor and editor. In 1864 he became editor of the *Quarterly Journal of Science*. He is the author of "Select Methods in Chemical Analysis"; of the "Manufacture of Beet-root Sugar in England"; of a "Handbook of Dyeing and Calico-Printing"; and of a Manual of "Dyeing and Tissue-Printing" (1882)—one of the "Technological Handbooks" prepared for the examinations of the City and Guilds of London Institute. He is also joint author of the English adaptation of Kerl's "Treatise on Metallurgy." He has edited the last three editions of Mitchell's "Manual of Practical Assaying," and has translated into English and edited Reimann's "Aniline and its Derivatives," Wagner's "Chemical Technology," Auerbach's "Anthracen and its Derivatives," and Ville's "Artificial Manures." An authority on sanitary questions, his views have been laid before the public in two pamphlets—"A Solution of the Sewage Question," and "The Profitable Disposal of Sewage." Mr. Crookes, in conjunction with Dr. Odling and the late Dr. Tidy, recently investigated the sanitary condition of the water supply of London. A long series of original investigations must be credited to Mr. Crookes, among which may be noted, 1863, "Sodium Amalgamation Process for Extracting Gold and Silver"; 1872-80, "Repulsion Resulting from Radiation." These investigations gave us the radiometer, and led to the vacuum experiments so valuable in electrical work. In 1879 the Royal Society published in its *Philosophical Transactions* records of Mr. Crookes's experiments on "Molecular Physics in High Vacua," comprising "Magnetic Deflection of Molecular Trajectory," "Laws of Magnetic Rotation in High and Low Vacua," and "Phosphorogenic Properties of Molecular Discharge." In the same year appeared a further Paper on "Repulsion Resulting from Radiation." The subject of his second Bakerian Lecture to the Royal Society was "Illumination of Lines of Molecular Pressure, and the Trajectory of Molecules." In the form of a lecture delivered before the British Association, under the title of "Radiant Matter," he compressed his researches on the electric discharge in high vacua. This lecture, fully illustrated, was reprinted in *The Electrician*. In 1880 the French Académie des Sciences bestowed on Mr. Crookes an extraordinary prize of 3,000 francs and a gold medal, in recognition of his discoveries in Molecular Physics and Radiant Matter. In 1881 Mr. Crookes acted as a juror at the International Exhibition of Electricity in Paris. In this official position he was not entitled to a medal, but in the official report his fellow jurors, after discussing the merits of four systems of incandescent lamps, declared—"None of them would have succeeded had it not been for these extreme vacua which Mr. Crookes has taught us to manage." It is stated that Mr. Crookes was the first to apply photography to the investigation of the solar spectrum; but his earlier researches were so numerous that it is impossible to refer to them all. It is well known that the value of an incandescent lamp depends greatly upon the perfection of the vacuum obtained; and in his Paper before the Royal Society in 1877 Mr. Crookes concluded that the most perfect vacuum then obtained, in which the pressure was only 0·4 millionth of an atmosphere, contains in each cubic centimetre no less than

Digitized by Google

250,000,000,000,000 molecules of air, as compared with Mr. Johnstone Stoney's estimate of the number of molecules contained in a cubic centimetre of ordinary air, which is 1,000,000,000,000,000,000,000 (one thousand trillions). In 1883 Mr. Crookes delivered the Bakerian Lecture for the third time before the Royal Society, the subject on this occasion being "Radiant Matter Spectroscopy: the Detection and Wide Distribution of Yttrium." In 1886 Mr. Crookes was elected President of the Chemical Section of the British Association; and at their Birmingham meeting that year he delivered an address in which he propounded some novel speculations on the probable origin of the chemical elements, showing that the balance of evidence was in favour of the view that our so-called elements have been formed by a process of evolution from one primordial matter. In 1887 he delivered a Friday evening discourse before the members of the Royal Institution, on the "Genesis of the Elements." In his address to the Chemical Society in 1888, on taking the president's chair, Mr. Crookes still further elaborated this theory, bringing forward numerous arguments, many of them based on experiments, to prove that the chemical elements are really compound bodies. These views were again urged, with numerous experimental proofs, in his presidential address to the same Society in 1889, and they are now generally accepted by chemists. In 1888 Mr. Crookes was awarded the Davy Medal of the Royal Society, for his Radiant Matter researches. Mr. Crookes was President for 1891 of the Institution of Electrical Engineers. He is a member of the Athenæum, Grosvenor, Savile, and Whitehall Clubs.

CURTOYS, Charles, M.I.E.E. Entered the service of the Electric and International Telegraph Company in 1851.

Mr. Curtoys afterwards became assistant secretary to the British and Irish Magnetic Telegraph Company, and upon the formation of the London and Provincial Telegraph Company was appointed secretary. In this position he remained until the transfer of that company to the Government. Mr. Curtoys has been secretary to the Consolidated Telephone Construction and Maintenance Company since the commencement of that undertaking in April, 1881, and was the first secretary of the River Plate Telephone Company, now amalgamated with another telephone company in Buenos Ayres.

DANVERS, Alan. Born in London on 21st August, 1861, and educated at the Merchant Taylors' School, and Christ's College, Finchley.

Leaving the latter in 1878, he commenced life in a commercial sphere in the City, but the stool proving distasteful, he at the commencement of 1880 went to the Electrical School of Engineering, in Hanover-street, W., from whence, after having studied telegraphy, telephony, and electricity generally, in their practical and theoretical branches, he passed the school examinations, and left. He then took service under the well-known Col. Gouraud, by whom he was sent to Binswood (Upper Norwood) to practise erecting lines and telephone exchanges. Upon the formation of the European Telephone Association, with Col. Gouraud as president, Mr. Danvers was sent to Turin in April, 1881, as assistant engineer, to erect an exchange. He also assisted in the erection of the exchanges at Milan and Venice. Upon the amalgamation of the European Company with other interests, under the new name of the Edison Gower-Bell Telephone Company of Europe, Limited, Mr. Danvers was sent by the company to Lisbon, in which country he can also claim to have erected the first telephone exchange, viz., in January, 1882. At the close of this year he was appointed as the company's sole representative and engineer-in-chief. In 1883 he received the honour of knighthood from the King of Portugal for having constructed and worked the telephone system so successfully; and for having transmitted an opera sung in the Opera House to the Royal Palace, five miles distant, at a time when the Court were unable to appear in public. Amongst other innovations he has adopted in the employment of the telephone, we may mention that in agreement with the Opera House directors, the opera is transmitted to subscribers' houses upon the payment of a subscription for the season, or a small amount per night. At the commencement of 1885 he was honoured with a special mission to Madrid on behalf of his company and the Consolidated Telephone Construction and Maintenance Company, which he carried out with entire satisfaction. Mr. Danvers in July, 1886, again proceeded to Madrid on behalf of the joint interest of the above companies, in order to inspect and report on the state of the existing telephone exchanges in Spain previous to their being put up for "Subasta" by the Government. Upon his return to Lisbon he received a very flattering recognition of his services in Spain from the Consolidated Company. Mr. Danvers in 1887 was instrumental in forming a new company in Portugal, for acquiring the rights and privileges of the Edison Gower-Bell Telephone Company of Europe, Limited, in that country. He is managing director and chief electrician of the Anglo-Portuguese Telephone Company, and has been successful in obtaining on its behalf a valuable concession from the Portuguese Government. Mr. Danvers is a member of the Institution of Electrical Engineers, and of the American Institute of Electrical Engineers. In April, 1893, he was created Baron Danvers, of the Kingdom of Portugal, in recognition of important services rendered during the last few years.

DELANY, Patrick Bernard. Born in King's County, Ireland, in the year 1845, and is the son of a farmer. He was taken to America at the age of ten. Educated in the common schools in Ireland, and parochial school in America.

Mr. Delany entered the telegraph service very early, and at 18 was ranked as first-class operator. At 20 he was considered one of the most expert telegraphists in America, and en-

Digitized by Google

joyed the reputation of being able to receive, by sound, from the fastest sender, and keep 20 words behind with his manuscript. Promotion came rapidly to young Delany, until at 25 he was superintendent of an important telegraph company. His first patented invention came out in 1873, and was an improvement in relays. Seven years later this invention was generally considered a valid substitute for the Page Patent Relay, which threatened a monopoly of the telegraph business in the United States. Mr. Delany was identified with an effort to establish automatic or machine telegraphy from 1872 to 1875. He went into journalism from 1877 to 1880, when his first invention of 1873 came into prominence and brought him back into the electrical field. From this time electrical invention became Mr. Delany's constant study. His patents, over 50 in number, cover a wide range. Among the most important are his anti-induction cables, now extensively manufactured at Pittsburg, Penn. The main feature of these cables is the separation of the insulated conductors by walls of lead integral with the enveloping pipes. Mr. Delany's improvements in synchronous multiplex telegraphy, facsimile telegraphy, and ocean-cable transmission are well known all over the world. Quite recently Mr. Delany's system of cable transmission attracted considerable attention by its performance of 20 words per minute, which were received on a Morse sounder, over the Anglo-American cable, from Duxbury to St. Pierre, a distance of nearly 900 miles. 34 words per minute were recorded by a Thomson Recorder. Mr. Delany has been honoured by the Franklin Institute in the bestowal of the Elliott-Cresson Gold Medal and the John Scott Legacy Medal. He received the Gold Medal and Diploma at the Inventions Exhibition, South Kensington, in 1885.

DÉRI, Max. Born at Bács (Hungary), in the year 1854.

From 1872 to 1877 he attended the Polytechnic College at Vienna, and after obtaining the degree of an engineer he showed a pronounced liking for electrical science, and made his first essays with induction apparatus; from 1878 to 1882 he was in the service of the Royal Hungarian Government as a hydraulic engineer, being occupied in the hydraulic works for the regulation of the rivers Danube and Theiss. During this time he continued his electrical studies, and the Hungarian Minister of Public Works sent him to Paris to study the Electrical Exhibition. In 1882 he was engaged as an electrical engineer by the firm of Ganz and Co., Budapest, where he has worked in conjunction with Mr. Zipernowsky and later with Mr. Bláthy. The name of Mr. Déri is connected with a number of inventions in electrotechnics, and in most of them he has worked in conjunction with these gentlemen. The most important letters patent he has taken out are: Self-exciting alternating-current dynamo, 1882; rotating secondary generator, 1884; improved induction apparatus for the transformation of electric currents (transformers), 1885; improvements in regulating alternating currents, 1886; dynamo compensator, 1885; improvements in distributing electricity, 1885; electric-current converting apparatus, 1888; improvements in distributing electric energy, 1888; improvements in alternating-current motors, 1889. Mr. Déri personally superintended the construction of the first alternating-current central stations with transformers of the Zipernowsky-Déri-Bláthy system in Lucerne, Milan, Rome and numerous others for the firm of Ganz and Co., until in 1889 a new company, the International Electric Company, was formed in Vienna of which Mr. Déri was chosen as Managing Director. In this position he has constructed several central stations, amongst them that in Vienna.

DESROZIERS, Edmond. Born in Paris in 1852.

M. Desroziers studied at the Ecole Supérieure des Mines, whose diploma he holds. His principal electrical work has been in connection with the compound dynamo (patented 1881-82), the disc pattern dynamo which bears his name (patented 1886), incandescence lamps of the Cruto and other types, electric measuring instruments (various patents), electrical distribution from central stations, and electric traction on railways (patented 1891). He is expert to the Conseil de Prefecture de la Seine and Chevalier of the Legion of Honour.

DEWAR, James, M.A., LL.D., F.R.S. Born in 1842, at Kincardine.

Prof. James Dewar was educated at Dollar Academy and the University of Edinburgh. He was appointed assistant to Dr. Lyon Playfair, then Professor of Chemistry in the University of Edinburgh, in 1863, and studied subsequently at Ghent. Prof. Dewar is Jacksonian Professor of Natural Experimental Philosophy in the University of Cambridge, and Fullerian Professor of Chemistry in the Royal Institution, which latter chair was formerly held by Faraday. He is the author of numerous Papers on Chemical and Physical subjects. He investigated the physiological action of light, in conjunction with Prof. M'Kendrick, of Glasgow, and succeeded in proving that the effect of light on the living retina is to produce a sudden alteration of its electrical condition. He has delivered many Christmas courses of lectures to the juveniles, amongst them being those on "A Soap Bubble" (1878-9), on "Alchemy in relation to Modern Science" (1883-4), and on "The Story of a Meteorite" (1885-6). In December, 1891, Prof. Dewar made a highly interesting communication to the Royal Society. On the occasion of the celebration at the Royal Institution of the centenary of Faraday's birth he gave several beautiful illustrations of the peculiarities of liquid oxygen, and he subsequently experimented with a view to ascertain its behaviour in the magnetic field. He had previously discovered that liquid oxygen did not moisten rock crystal, and consequently maintained a perfect spheroidal state when in contact with that substance. Some liquid oxygen, at a temperature of −180°C., was placed in a shallow cup of rock crystal and

Digitized by Google

placed between the poles of Faraday's historic electromagnet. On the magnet being excited the whole mass of liquid adhered to the poles, showing that oxygen, which is only feebly magnetic at ordinary temperatures, becomes at −180°C. highly susceptible to magnetism.

DOBSON, Sydney Thornton, Assoc.M.I.C.E., M.I.E.E. Born in London 1866, educated at St. Paul's College, Stoney Stratford, and King's College School, London.

Mr. Dobson after a twelve months' technical training entered the service of Messrs. Edmunds and Goolden as an improver, and was engaged for some time on installation work, and in running the Hochhausen plant exhibited by that firm at the Health Exhibition. In September, 1884, he apprenticed himself to Messrs. R. E. Crompton and Co., passing through the various departments, and being occupied during the latter portion of his time in carrying out experimental work under Mr. James Swinburne. In March, 1887, he was sent by Messrs. Crompton to their installation at the Tilbury Docks, where he acted as second engineer. In September, 1887, he left for Vienna to take up a position on the electrical staff of the Imperial Continental Gas Association, and as senior assistant had charge of the large central station employed in lighting the Court Theatres. This station at the time was the largest example of supply by means of low-pressure currents and storage batteries, the distribution being effected on a four-wire system. In September, 1889, Mr. Dobson resigned his position on this Association, and returned to England to take up his appointment as chief engineer to the St. James's and Pall Mall Electric Light Company (Limited), where his work has met with most successful results.

DOLBEAR, Prof. Amos Emerson, was born in Norwich, Conn., U.S.A., in the year 1837.

At the beginning of 1854 young Dolbear was put to work in the pistol factory of Allen and Thurber, at Worcester, Mass. While he was at work in the pistol shop, Dolbear began his first experiments in electricity and magnetism. From Worcester he went to Missouri, where for four years he taught school, and then entered Mason's Locomotive Works at Taunton, Mass. While there he constructed a magneto-electric machine. In 1863 he went to work in the Armoury at Springfield, Mass., and fitted himself for college by study out of work hours. Thence he entered the Ohio Wesleyan College, at Delaware, Ohio, and was graduated in 1866. While an undergraduate he invented a magneto-electric telegraph, in which the current of electricity was generated by the action of a permanent magnet when thrust into or withdrawn from a hollow bobbin. This was designed to move a needle. He also proposed to have a like instrument at the receiving station, which he supposed would duplicate the movements of the first instrument. The receiving magnet was to be furnished with a pen, and thus register the movements of the transmitting one. He saw that the movements of the second would of necessity be precisely like those of the first, but did not at that time know that the movement of the second would be so feeble as it actually is. The year 1867 was spent by Dolbear as a student at the University of Ann Arbor, Mich. He graduated as Mining Engineer at Michigan University in 1867. After his graduation, Dolbear became Professor of Natural Science in West Virginia until 1874, when he received the appointment as Professor of Physics, at Tufts College, College Hill, Mass., where he has been located ever since. During the years 1867-74 he continued his experiments in electrical science. He, for example, discovered the convertibility of sound vibrations into electricity. Using a tuning-fork in connection with a thermo-pile and galvanometer, he noticed that when the fork vibrated the needle was deflected. He further observed the effect of a vibrating tuning-fork, which was also a magnet, upon the current from a thermo-pile. At the Portland meeting of the American Association, in 1873, Dolbear read a short Paper in regard to the first of these experiments, which he thought was new, but said nothing about the second, as he deemed it only a particular case of magneto-currents which were well known. It was in 1876 that Prof. Dolbear began his experiments in telephony, using at first a Helmholtz interrupter and electro-magnets. He now thought (December, 1876) of obtaining a patent upon his speaking telephone with permanent magnets, which he had invented in September, 1876; but before he had completed his patent model he was informed that Prof. A. Graham Bell "had declared that he had secured a patent upon the same thing two or three years before." In 1879 Professor Dolbear perfected an entirely new (static) system of telephony, which was patented in 1881. Prof. Dolbear's contributions to the scientific press have been numerous and interesting.

DOUBRAVA, Stefan. Born in 1857 at Brünn (Austria), graduate of the Universities of Prague and Vienna.

Doubrava in 1881 graduated as Doctor of Mathematics and Physics at the University of Prague, and in 1883 became Lecturer in Electricity. In 1884 he commenced as an electrical engineer, and in 1886 he entered the establishment of Robert Bartelmus in Brünn as partner. His first works "On the Identity of the Two Electricities," "The Electrical Perforation of Glass," "On the Movement of Plates between the Electrodes of a Holtz Machine," and on "Vortex Motions," were published among the Proceedings of the Vienna Academy. In 1885 he constructed an arc lamp, depending simply on the action of electro-magnets and solenoids without weights and gear wheels. At the Paris Exhibition this received a gold medal (with the firm Steinber and Co., Mulhausen). He has published in the German and English technical press a series of articles on dynamos, arc lamps, the production of sparks, the transformation of continuous currents by means of condensers, on condenser effects, electric light stations, the action of electro-magnets, &c.

DOWN, F. J. Born at Bristol, and educated at Sandicroft College, Cheshire.

Mr. Down went from school to Glasgow as apprentice to A. and W. Smith, general engineers; and afterwards studied physics, chemistry, &c., with the celebrated Prof. Fresenius, at Wiesbaden, Nassau. Returning to England, he joined the staff of Messrs. C. Tennant and Co., chemical manufacturers, and afterwards the Blaydon Chemical Company, to carry out several new chemical processes being introduced there, and subsequently joined the Silicate Paint Company, of Charlton, to introduce there and erect the plant for a new sulphide of barium process, which is largely used for making their non-poisonous paints. After the appointment of Messrs. Laing and Wharton as agents of the original Swan Company he joined this firm, now known as Laing, Wharton and Down, who, as electric light engineers and contractors, have already successfully carried out several hundred electric-light installations. They it was who brought from America the celebrated Thomson-Houston system of electric lighting, now so largely used, and which was chosen for lighting the Eastern Division of the City of London. This system created great interest at the Inventions Exhibition, 1885, and was exclusively employed in lighting the American Exhibition of 1887, the Italian Exhibition, 1888, and the Military Exhibition, 1890.

DRESING, Peter Christian, M.I.E.E. Born at Aalborg, in Jutland, Denmark, October 21, 1852, and educated at the Cathedral Grammar School, Aalborg.

After serving an apprenticeship in pharmaceutical chemistry Mr. Dresing came to England in 1871, and entered the service of the Great Northern Telegraph Company, in whose employ he has remained ever since. In 1873 he was appointed on a special staff, which, under Capt. Hoskiær, superintended the manufacture and laying of about 1,000 nautical miles of submarine telegraph cable for the above-named company, the contractor being Mr. W. T. Henley, of North Woolwich. Mr. Dresing went to China in 1874, with 70 nautical miles of different types of heavy spare cable, and after his return to England he was appointed electrician at the company's Aberdeen Station, where he remained from 1875 to 1879, with the exception of two or three months of each winter, which he spent on cable repairs in the North Sea, thus acquiring a great amount of practical knowledge of submarine cable work. In 1879 Mr. Dresing was promoted as engineer and electrician to the company, and attached to the London office, and in 1883 he superintended the manufacture and laying of 1,300 nautical miles of duplicate cable for the company's system in Chinese and Japanese waters, and undertook a special tour of inspection of the Company's stations in the Far East. After his return to Europe he was appointed at the company's head office in Copenhagen, where he now holds the post of the company's superintending engineer. In 1890 and 1891 he superintended the manufacture and laying of the Company's two new North Sea cables—the duplicate Anglo-Swedish and Franco-Danish cables respectively—of a total length of about 900 knots. Mr. Dresing has been the instructor of most of the company's electricians, and he superintends the technical education of the younger members of the staff. He was elected an Associate of the Society of Telegraph-Engineers (now the Institution of Electrical Engineers) in 1875, in 1880 he was made a Member, and in 1890 he was appointed Local Hon. Secretary for Denmark. Mr. Dresing published a "New Formula for Calculating the Copper Resistance during Electric Disturbances (Earth Currents)," in 1877; in the following year a Paper on "Earth Currents;" and in 1891 a Paper "On the Induction in Multiple Core Cables."

DU BOIS, H. E. J. G., Ph.D. (Strasburg). Born in Velp (Holland), in 1863. Educated at the Polytechnic School, Delft, and at the Universities of Glasgow, Strasburg and Berlin.

After having passed through the higher preparatory municipal school of the Hague, Dr. du Bois studied mechanical engineering at the Polytechnic School of Delft. He there worked in Prof. Bosscha's physical laboratory, chiefly in electricity, the applications of which were then (1881-83) developing with great rapidity. He was also practically employed in an engine works for a short time. In order to pursue the subject at one of its chief sources, he went to Glasgow University, where he worked in the physical laboratory for 15 months, mainly occupied with working out new electrical appliances under Lord Kelvin's (then Sir William Thomson's) direction, at the same time, however, obtaining a nearer insight into the particular character of British science than would otherwise have been possible for him. In 1885 he went to Strasburg University to pursue his studies and work in the new Physical Institute under Prof. Kundt. In 1887 he graduated in physics, mathematics and chemistry, with a dissertation on "Magnetic Circular Polarisation in Cobalt and Nickel"; he afterwards carried out investigations on Kerr's Phenomenon, diamagnetism and kindred subjects. Prof. Kundt having been appointed to the Chair of Experimental Physics of Berlin University in 1888, Dr. du Bois remained in Strasburg under his successor, Prof. F. Kohlrausch, until the end of 1889, when he followed his former teacher to the German Metropolis. There he has since been working in the University Physical Institute at various subjects, chiefly electromagnetic or optical, and superintending the experimental work of part of the advanced students. He has published a series of contributions on the theory of Magnetic Circuits, forming the basis of a work on that subject just published. He was appointed a "Privat Docent" in Berlin University in 1892. He has also directed his attention to the construction of apparatus of a scientific and practical character. He is a Fellow of the Glasgow University Physical Society, a member of the Berlin Physikalische Gesellschaft and Elektrotechnischer Verein. He has published over a dozen Papers in addition to his dissertation.

DU BOIS-REYMOND, Emil, Professor of Physiology at the Berlin University, Secretary to the Royal Prussian Academy of Sciences, F.R.S., &c. Born at Berlin in 1818.

By his father he is of Swiss origin, by his mother of Huguenot descent. He was educated partly at the French College of his native town, partly at the College of Neuchâtel, in Switzerland. In 1837 he entered upon the study of natural science at the Berlin University, and pursued it at Bonn during the summer session of 1838, but returning to Berlin exchanged it for medical studies in the autumn of 1839. As a medical student he became a pupil of the illustrious anatomist and physiologist, John Müller, who, in the spring of 1841, directed his attention towards animal electricity, and encouraged him to continue Galvani's, Nobili's, and Matteucci's work. In 1843, after publishing a preliminary account of his discoveries, including the true law of the muscular current, its negative variation during contraction, and of the nervous current, he graduated Doctor of Medicine, and in 1846 was admitted as Privat-docent in the medical faculty of the University. In 1845 he became one of the founders of that nursery of physical science, the Berlin Physical Society, of which he still is honorary president. In the meanwhile he had carried on his researches in animal electricity, and in 1848 and 1849 he published the two first volumes of his large work on that subject, the third and concluding volume of which appeared in two instalments in 1860 and 1884. In recognition of the value of that publication, he was in 1851 elected a member of the Berlin Academy of Sciences. Baron Humboldt gave notice to the Académie des Sciences of Du Bois-Reymond's experiment on the negative variation of the muscular current on the living human being; but Becquerel and Despretz having denied the fact, Du Bois-Reymond went to Paris in 1850 with his galvanometer of then unsurpassed sensitiveness, and a report by Pouillet settled the matter in his favour. In 1851 Dr. Bence Jones, of London, went over to Berlin to see Du Bois-Reymond's experiments, and invited him to come to London to show them at the Royal Institution, where Faraday took great interest in them; and in 1855 Du Bois-Reymond was invited to come over a second time to lecture at the Institution. Eleven years later, in 1866, he came over a third time, lectured at the Institution, and gave a Friday evening lecture "On the Time Required for the Transmission of Volition and Sensation through the Nerves," when he demonstrated with his spring myographion Helmholtz's fundamental experiment. In 1858 John Muller died, and although Du Bois-Reymond up to that time had not had the opportunity of distinguishing himself as a university lecturer, he was appointed his successor, and since then he has filled the first chair of physiology in Germany, and a great many professors of the new generation have been his pupils. A magnificent laboratory was erected in Berlin under his superintendence, and there he is still teaching the science to which he has devoted his life. He has also succeeded Müller as the editor of the *Archiv für Physiologie*. A collection of his numerous papers on the general physiology of muscle and nerve, and on the electrical organs of fishes, appeared in two volumes in 1875 and 1877. Many of his experimental contrivances are in use in the physical and physiological laboratories for research and for demonstration—the sliding inductorium, the current-key, the rheochord, the compensator, the aperiodic magnet, the muscular telegraph and alarum, the frog-interrupter, &c. In May, 1855, he showed at the Royal Institution the most delicate experiments on animal electricity—*i.e.*, the negative variation of the nervous current during action—by means of a beam of electric light reflected from a mirror connected with the astatic system of the galvanometer. In 1867 Du Bois-Reymond was appointed one of the secretaries of the Academy. He also twice, in 1870-71 and 1882-83, filled the office of a rector of the University. In these positions he has delivered a number of addresses, which were collected in two volumes in 1886 and 1887. He also, in 1872, gave a discourse at the meeting of the German Association of Scientists and Physicians at Leipzig, "On the Limits of Natural Knowledge," which has received much attention, and has gone through many editions.

DVOŘAK, Vincenz. Born in Dusejov, Bohemia, in 1848. Visited in 1866 the University of Prague, where, in 1871, he became assistant to Prof. Mach, and Lecturer for Physics in 1874. In 1875 he was called to the University in Agram as Professor.

His first work related chiefly to optics and acoustics. Several of his experiments concerning acoustic attraction and repulsion, continued since the year 1875, led him to investigate the analogies between sound waves and electrical and magnetic phenomena. Similar experiments of Bjerknes, exhibited by the latter at the Paris Electrical Exhibition in 1881, and those of Stroh, shown at the Society of Telegraph-Engineers in London in 1882, excited the greatest interest among scientific men, although they had as yet not found any application for practical purposes. At the opening of the Vienna Exhibition in 1883 Mr. Dvorák was requested to exhibit the apparatus which he had just completed for the purpose of further experiments, and it was brought before the scientific world in a lecture delivered before the Austrian Society of Electricians in Vienna, and published in the *Zeitschrift des Elektrotechnischen Vereins*, 1884, Vol. II. Prof. S. P. Thompson also described those experiments relating to acoustics in *Nature* of February, 1884. Mr. W. H. Preece, who interested himself in the apparatus, took a part of it to London and exhibited it before the Royal Society and the Society of Telegraph-Engineers. The experiments were intended to prove that the most varied phenomena of attraction—repulsion and current—could be imitated simply by means of vibrations of air. The theory that electricity and magnetism are only a peculiar vibratory condition

THOMAS ALVA EDISON.

Digitized by Google

of some medium would thus gain strength by analogy with mechanical illustrations. He also proved that the hitherto generally accepted opinion concerning the electrostatic action of flames is not tenable. In 1889 he wrote "Ueber die Wirkung der Selbstinduction bei elektromagnetischen Stromunterbrechern" (Academy of Vienna).

EDISON, Thomas Alva. Born on February 11, 1847, at Milan, Erie Co., Ohio.

Without a regular school education, and largely indebted to his mother for his early instruction, young Edison achieved his own education. At twelve years of age he became a train boy on the Grand Trunk Railway, after which he became a newsvendor on his own account, employing four boy assistants. Becoming acquainted with the clerks in the telegraph office at Detroit, his attention was called to that department, and he worked so hard to make himself perfect in it, often practising the whole of the night, that his proficiency procured him in five weeks an appointment in the telegraph station at Port Huron. After serving in various telegraph offices he invented the first perfect automatic repeater. In 1864 he removed to Memphis, when the automatic repeater was put into service. He then devoted himself to the study of duplex transmission. When the Government of the United States gave up the wires to the Telegraph Company Edison was discharged, and he transferred himself to the telegraph office at Louisville, where he published a treatise of his own composition on electricity. His propensity to experimentalise cost him his situation, as he one day contrived to overturn a carboy of sulphuric acid, which occasioned some damage to the offices. In 1868 he was appointed to a post in Boston, where, in the head official, he found at last a man who appreciated his value. Edison opened at the same time a workshop, where he put many of his designs into practical shape. Improvements in electric telegraphy henceforth gained him much fame and wealth. He originated a dial instrument for the use of private lines, several of which he set going. He completed his first "private line printer," and put eight of them into active service. The Western Union Telegraph Company soon afterwards entered into an arrangement with Edison, at a high salary, and his improvements quickly superseded the existing apparatus, and are still in operation. His electrical laboratories at Newark, where he employed three hundred men, procured him the opportunity of bringing out many of his patents, and it may be stated that at one time he was engaged in bringing out simultaneously no fewer than forty-five distinct inventions. The profits of the manufactory, together with the proceeds of patents, at that time amounted to £80,000, all of which was again expended on products of his genius. In 1876 he disposed of his plant, and removed to Menlo Park, N.J. In 1887, finding his works at Menlo Park to be too contracted for his requirements, he quitted them after erecting in Orange, N.J., what is probably the largest experimental laboratory of its kind in the world. He has also in operation several large factories in New York, Schenectady, N.Y., Newark, and Orange, N.J., engaged in the manufacture of his inventions. Mr. Edison has taken out about 750 patents, most of them in use, directed to numerous improvements in telegraphy, electro-metallurgy, electric lighting, and the electrical transmission of power. He has recently perfected the phonograph and kinetograph, and is directing a large field of operations at the Ogden (N.J.) mines in connection with his new magnetic ore separators.

EDMUNDS, Henry. Born in Halifax in 1853. He has been largely identified with the introduction and progress of electric lighting.

In 1877 he introduced the Jablochkoff and Werdermann electric candles into the United States, and the same year he returned to this country with the Wallace-Farmer dynamo and plate lamp, the first arc lamp run in series with continuous current. In 1878 he introduced Edison's phonograph into this country, the first one made here being constructed by Mr. Augustus Stroh under his directions. About the same time Mr. Edmunds invented the "Phonoscope," an instrument showing the vibrations of sound in rays of light. He also invented an apparatus for signalling under water, which he termed the "Aquaphone." In 1878 he assisted in the formation of the Anglo-American Electric Light Company for the development of the Farmer-Wallace system. In 1379 this company deputed him to inquire into other American patents, the result being the acquisition of the patents of Mr. Brush and the formation of the Anglo-American (Brush) Electric Light Corporation. In 1880 Mr. Edmunds became interested with Mr. J. W. Swan in his incandescence lamp, and gave the first exhibition of the new illuminant in London at the *soirée* of the Royal Academy. He installed the new light upon the "City of Richmond," the first ship in the world to be lighted by incandescence, and introduced this system into the British Navy by the lighting up of H.M.S. "Inflexible." At the Paris Exhibition of Electricity he took charge of the Swan exhibit, and later on he lighted up the Grand Opera House. The next year he visited the United States, to introduce the Swan lamp into that country, and he assisted the Brush-Swan Electric Light Company in the development of electric lighting there. On his return he exhibited the Hochhausen arc light at the Fisheries Exhibition of 1883, at South Kensington, and showed a mast-light of six lamps. This method of illuminating large open spaces, although already employed in America, was then quite unknown in this country, and it created a great sensation. Mr. Edmunds had always taken great interest in the distribution of electricity by accumulators, and gained considerable experience with them in America. The difficulties connected with their use on a large scale induced him to devise a system of his own, and he read a paper on this subject before the Society of Telegraph-Engineers in the latter part of 1888. In the same year he brought over from America the Tainter Grapho-

Digitized by Google

phone, which was exhibited at the British Association, the Society of Arts, and other places. and excited great interest owing to its marked improvement upon the performance of the first phonograph of Edison. During the last seven years Mr. Edmunds was a partner in the well-known firm of Walter T. Glover and Co. Owing to the illness of Mr. Glover in 1891, the sole responsibility of the business devolved upon Mr. Edmunds, who has since become sole proprietor. He has devoted himself to the improvement of conductors for electrical purposes, and has taken out severla patents for the same.

EGGINGTON, A. Born in Lichfield, Staffordshire, January 26, 1841.

Mr. Eggington entered the Telegraph Service in 1857, in the Submarine Telegraph Company, and the Government service three years later, under an engagement to proceed to the Malacca Straits to work the Rangoon cable. He joined the first of the three large steamers chartered by Messrs. Siemens and Halske, the "Queen Victoria," which, after various minor disasters and delays, ran aground at Wilderness Point, under Mount Edgcumbe, and became a wreck. He then entered the United Kingdom Company, which was then fighting its powerful rivals, the Electric and Magnetic Companies; and in 1861 accepted an appointment under Messrs. Glass, Elliott and Co. to proceed to Italy, to supervise the transit of the English telegrams to and from the East. In 1862 he was appointed to Bengasi Station (Barbary), and after four years in Africa he returned to Italy. In 1868 he was clerk in charge of the Turin office of the Susa-Modica line, belonging to the Telegraph Construction and Maintenance Company, and remained there until appointed by the new Société du Cable Française as office superintendent at Brest. He returned to Italy, Christmas, 1869, to become general superintendent of the above-mentioned Susa-Modica line.

Since that time he has always represented the Anglo-Mediterranean Company, which was fused with other companies in the Eastern Telegraph Company, in Italy, his headquarters being now at Rome. As representative of the Eastern he has to look after the many cables belonging to that company in Italian waters. At the Turin Exhibition the King of Italy was especially complimentary, and the jury awarded the Eastern Telegraph Company the highest possible honour, namely, the *diploma d'onore*. King Humbert some years ago conferred upon Mr. Eggington the Cross of the Crown of Italy and the title of Chevalier, and in 1887 he was promoted to a higher grade of the same Order. He designed some years ago a multiple-wired automatic lightning guard, which has proved very useful in cable huts; it is used on some of the Eastern Company's lines, and in two of the Italian Government Stations. This lightning guard was exhibited at an early meeting of the Society of Telegraph-Engineers. Mr. Eggington has been a contributor to the Italian scientific periodical, *L'Elettricista*, later on re-named *La Natura*.

ESSON, W. B. Born in Aberdeen, March, 1858.

At the age of fifteen Mr. Esson entered the engineering works of Messrs. Wm. McKinnon and Company, of Aberdeen, as an apprentice, leaving this firm three years later to attend the lectures on engineering at the Royal School of Mines. At this school he obtained the highest position in Applied Mechanics, and on finishing his studies entered a marine engineering works as draughtsman. In 1878 he entered the service of the Thames Iron Works and Shipbuilding Company, Blackwall, taking charge while there of the designing in the mechanical engineering department. Amongst other things Mr. Esson designed the paying-out gear and equipment for several cable ships, and it was here in 1881 that, while carrying out experiments for Mr. A. F. Hills, the managing director, his attention was turned to the subject of electric lighting. He had at the Thames Iron Works every opportunity of experimenting with the then best-known dynamos and lamps, and with a view to obtaining as thorough a knowledge of machines as then existed, he attended at the same time Prof. Ayrton's lectures at Finsbury Technical College. In 1883 Mr. Esson obtained at this College the second place in Electrical Instrument Making, and in the same year the silver medal of the City and Guilds of London Institute, in the Honours Grade of Electric Lighting and Transmission of Power. In August, 1883, he entered the firm of Messrs. Paterson and Cooper, as chief electrician, twelve months later becoming manager also. Mr. Esson retained this position until 1892, when he left to undertake the management of the Gülcher Electric Light and Power Company, Limited. The central stations for Wellington and Christchurch, New Zealand, are being equipped with plant constructed to his designs. He is well known in connection with the development of electric lighting, having made from time to time important contributions to the literature of the dynamo, which have appeared in *The Electrician* and other technical journals. He is amongst the engineers who took up electric lighting in this country when it was beginning to be recognised as having a future before it, and has worked with untiring energy to make this future a brilliant one. Mr. Esson is a member of the council of the Institution of Electrical Engineers, and to his Paper, "Some Points on Dynamo and Motor Designs," was awarded in 1890 the Premium of the Institution. He is also an Associate Member of the Institution of Civil Engineers, and served on the Jury of the Crystal Palace Electrical Exhibition in 1892.

EVERSHED, Sydney. Born in 1857; was educated privately, and has never passed an examination, nor even attempted to do so. He gained no prizes at school, and has never held a scholarship.

Having early shown mechanical tastes, he was apprenticed, in 1876, to a London optician, but his health failing at the end of the first year, he spent the next seven years in a manu-

factory then just started near Guildford. Becoming manager in 1879, he was engaged in designing and constructing the whole of the new machinery and plant required in the development of the business. During this period he continued his electrical studies, and carried out a lengthy series of observations on atmospheric electricity. Among other work done at this time may be mentioned a research on the potential difference due to contact. In 1884 he resigned his position as manager in order to devote himself entirely to electrical work, and at the latter end of the year entered the instrument department of the Hammond Electric Light Company, where he remained until the liquidation of the company. After devoting the greater part of the next year to the development of the measuring instruments with which his name is associated, in 1886 he became manager of Messrs. Goolden and Trotter's instrument factory, and he still holds this position under the present firm. He is an Associate Member of the Institute of Electrical Engineers. He is an occasional contributor to the technical journals, and is understood to be engaged on an exhaustive "History of Self-Induction, from the time of Thales down to Dr. Fleming."

EWING, J. A., Hon. M.A. (Camb.), B.Sc. (Edin.), F.R.S., F.R.S.E., M.Inst.C.E. Born at Dundee, March 27, 1855; educated at the University of Edinburgh, where he graduated in Science.

Mr. Ewing became assistant in 1872 to Sir William Thomson and the late Prof. Fleeming Jenkin in telegraph engineering and other work, and took part in the Western and Brazilian, Platino-Brazileira, and other cable expeditions on their behalf. He was appointed in 1878 to the Professorship of Mechanical Engineering at the University of Tokio, Japan, which he resigned in 1883 to become Professor of Engineering at University College, Dundee. In November, 1890, he was elected to the Professorship of Applied Mechanics and Mechanism in the University of Cambridge—a post which he now holds. Prof. Ewing is the author of a large number of Papers on electrical and other scientific and engineering subjects. His earliest research was conducted in Prof. Tait's laboratory in 1872-3, with a fellow-student (now Prof. J. G. MacGregor), "On the Electrical Conductivity of certain Saline Solutions," and was published in the Edinburgh Royal Society's *Transactions* in 1873. This was followed in 1877 by a Paper in the *Phil. Trans.* describing the result of experiments "On Friction at Slow Speeds," by Profs. Fleeming Jenkin and Ewing conjointly. When the invention of Mr. Edison's phonograph was announced, Prof. Ewing (again in conjunction with Prof. Fleeming Jenkin) took advantage of it to perform an extensive series of experiments "On the Harmonic Analysis of Vowel Sounds," the results of which were published by the Royal Society of Edinburgh in their *Transactions* for 1878. During his residence in Japan he devoted much attention to the scientific examination of earthquakes, and designed instruments by which it became practicable to make absolute measurements of earthquake motion. These instruments and the conclusions which have been established by observations made with them are described in papers in the *Transactions* of the Seismological Society of Japan, the *Proceedings* of the Royal Society, and *Nature*, and also in his "Memoir on Earthquake Measurement" published by the University of Tokio, 1833. Prof. Ewing's seismographs have been adopted as standard instruments for the registration of earthquakes at a number of observatories, and have also been applied to measure the stiffness of engineering structures (*Proc.* Roy. Soc., 1888). From time to time during the last ten years he has communicated to the Royal Society the results of an elaborate series of experimental researches in magnetism and thermo-electricity. One of the facts brought out in his earliest magnetic Paper is that soft iron, contrary to previously-received notions, retains more magnetism when left completely undisturbed, after the inducing force is withdrawn, than steel or any other known substance. The term "hysteresis," introduced by Prof. Ewing to describe certain effects connected with retentiveness, is now a generally accepted addition to the electrician's vocabulary. The experiments are described in the following Papers published in the *Philosophical Transactions*—"Experimental Researches in Magnetism" (1885), "Effects of Stress and Magnetisation on the Thermoelectric Quality of Metals" (1886), "Magnetic Qualities of Nickel" (1888). A more recent research on the "Magnetisation of Iron in Strong Fields" (*Proc.* Roy. Soc. and B. A. *Report*, 1887, and *Phil. Trans.*, 1889) has shown that iron is capable of a far higher degree of magnetisation than was believed possible; and another on "Time-Lag in the Magnetisation of Iron" (*Proc.* Roy. Soc., 1889) has described the sluggishness which soft iron shows in responding to changes of magnetic force. Another Paper in the *Phil. Trans.* for 1893 describes a further series of experiments on the "Magnetic Qualities of Iron," made in conjunction with Miss H. G. Klaassen, which relate specially to measurements of the expenditure of energy in magnetic reversals. Other Papers are ("On Certain Effects of Stress in Soft Iron" *Proc.* Roy. Soc., 1881); "On the Production of Transient Electric Currents" (*Proc.* Roy. Soc. 1883); "On the Influence of a Plane of Transverse Section on the Magnetic Permeability of Iron" (B. A. *Report*, 1887; *Phil. Mag.*, Sept., 1888); "On the Magnetisation of Manganese Steel" (B. A. *Report*, 1887); "On Hysteresis, &c., in Transformer Cores" (*The Electrician*, April, 1892); "On Joints in Magnetic Circuits" (*Phil. Mag.*, 1892). Amongst Prof. Ewing's contributions to the subject of Magnetism is a molecular theory (*Proc.* Roy. Soc., June, 1890), which was explained at the Leeds (1890) meeting of the British Association by aid of a model, and attracted much attention. His treatise on "Magnetic Induction in Iron and other Metals" (1892)—one of the volumes of *The Electrician* Series of Standard Scientific Works—gives a connected account of much recent research

Digitized by Google

bearing on the same subject. At the Edinburgh meeting of the British Association (1892), Prof. Ewing showed his "Magnetic Curve Tracer," an instrument which exhibits by the movement of a single mirror the relation of magnetisation to magnetising force in any magnetising process, and allows the magnetic qualities of samples of iron or steel to be tested completely and very simply. He was co-patentee with the late Prof. Jenkin of several inventions in general and electrical engineering. He is author of the articles "Steam Engine," "Strength of Materials," "Seismometer," "Sewerage," "Electric Traction," and others in the last edition of the *Encyclopædia Britannica*.

Dynamo," "Electric Light," and "Gas Engines" are among articles contributed by him to the revised issue of *Chambers' Encyclopædia*. He was elected a Fellow of the Royal Society in 1887.

FAURE, Camille A. Born at Vizille, in the mountains of Dauphiné, France, of an old family of peasant landowners.

Although M. Faure received some instruction at the professional school and at the Ecole des Arts et Métiers he must be considered as self-taught. From 1859 to 1872 he found successive and uninterrupted employment as mechanical draughtsman, or in superintending the erection of metal works, at sixteen different large establishments in the South of France, Paris, and England; in the latter country he was for three years managing draughtsman at De Bergue and Co.'s. In 1859 he invented the "black bottle" nitric acid battery, manufactured by Elliott Brothers. In 1872 there is a record of his attempt at obtaining a secondary battery. The making and development of Faure is greatly due to his quiet and long stay with the Cotton Powder Company, whose works at Faversham, Kent, he erected for the manufacture of the explosive "tonite," well known and largely employed in this country. This is his invention, together with the distress signals almost exclusively used by the Board of Trade and the Mercantile navy. During this employment as chemical engineer from 1872 to 1880 he had large means and spare time for study and experiments, and he turned his attention to a great number of subjects. We find in the *Mining Journal* two or three very able communications by him on thermo-chemistry as applied to explosives. In 1878 he returned from a visit to the Paris Exhibition with the idea of his secondary battery well fixed in his mind, and within a month he had discovered spongy metallic lead obtained from insoluble oxides, and perceived its value as a material for negative plates, which was previously unknown. The battery was conceived; there remained the possible drawback of irremediable sulfatation. This was afterwards finally disposed of by obtaining a secondary battery out of elements made entirely of sulphate of lead. This battery completed, M. Faure, as a true inventor in spirit and in ignorance of business, ran immediately into new thoughts, leaving to others the commercial development of his invention. However, in 1882 he improved his battery by perforating the plates and alloying the lead of the supports with antimony. The Patent Office is well acquainted with the work of M. Faure in various directions, and particularly in his attempts to utilise electricity in the manufacture of aluminium. A Paper by him "On the Manufacture of Aluminium Chloride in a very Novel and Economical Way" was read by M. Berthelot before the French Academy of Science in August, 1888. The practical way of electrolysing chloride of sodium has occupied M. Faure's thoughts since 1872. The enormous waste water power of Dauphiné has also attracted his attention, and he has brought out a scheme for utilising a fall of 20,000 H.P. A petroleum motor of M. Faure's invention, which possesses novel features, is also on the market.

FAWCUS, W. P. James, A.M.I.C.E.

Mr. Fawcus was educated at Wellington College and University College, London. He served his time as an engineer with Messrs. Bells, Lightfoot and Co., of Walker-on-Tyne, and in 1880 entered the service of the firm of J. and E. Hall, engineers, of Dartford. In 1881 he became assistant to Mr. T. B. Lightfoot, consulting engineer. In 1882 he joined the staff of Messrs. John I. Thornycroft and Co., torpedo boat builders, of Chiswick, as engineer, remaining with this firm until 1884. In 1885 Mr. Fawcus became assistant to Mr. Arthur Rigg, engineer, of London, for whom he organised and started works at Haggerston, and the Victoria Engine Works, Chester. Of the latter works he was appointed manager in 1886, which appointment he held until 1889. In 1888, in conjunction with Mr. Edw. W. Cowan, Mr. Fawcus formed the firm of Fawcus and Cowan, of Chester. This firm were appointed engineers to the Keswick Electric Light Company, and designed and carried out for them their central station, the first in the United Kingdom to be driven by water-power. In 1889 Mr. Fawcus was appointed manager to the Manchester Edison-Swan Company, and was elected managing director in 1890. Since his connection with this Company he has designed and carried out many large lighting installations and other engineering works at home and abroad, and has been associated in the design and construction of several central stations for both alternate and direct current, a class of work in which he has considerable experience. He is joint patentee of the Fawcus-Cowan slow-speed dynamo. He is the author of several Papers on engineering and allied subjects, two of which, written jointly with Mr. Cowan, on "A Light Draught Launch," and "The Keswick Water-power Central Station," were read before the Institution of Civil Engineers, and obtained a "Miller" prize and a "Manby" donation.

FERRARIS, GALILEO, Civil Engineer Doctor of Science, Principal and Professor of Technical Physics and Electrotechnics at the Royal Museo Industriale Italiano in Turin. Born in Livorno, Piedmont, Italy, in 1847; educated in Turin at the Royal

Digitized by Google

Università and the Royal Scuola di Applicazione degli Ingegneri.

Galileo Ferraris was graduated Bachelor of Mathematics and Physics at the University of Turin in 1867, and civil engineer at the Royal Scuola di Applicazione degli Ingegneri di Torino in 1869. On that occasion he published a Paper on "The Telodynamic Transmission of Hirn," which was the first Paper on this subject printed in Italy. As soon as he left the University he was appointed assistant to Prof. G. Codazza, then Professor of Technical Physics at the Royal Museo Industriale Italiano; and since that time has devoted himself entirely to the study and teaching of physical science. In 1872 he was selected out of several candidates to fill the position of Dottor Aggregato in the Faculty of Mathematics, Physics, and Natural Science at the University of Turin, being at the same time elected member of the Academic body of the University, on which occasion he read a lengthy Paper on "The Mathematical Theory of the Propagation of Electricity through Homogeneous Bodies." In 1877 Prof. Ferraris took sole charge of the course on technical physics at the Royal Museo Industriale Italiano in Turin; and in 1879 a Royal decree elected him Principal and Professor of the Chair of Technical Physics at the same institution. At this time he devoted himself chiefly to geometrical optics, and to the scientific and practical developments of the applications of electricity and heat, and published in Turin in 1877 an important book, entitled "Le Proprietà Cardinali degli Strumenti Diottrici," which was translated into German by Prof. Lippich, of Prague, under the title, "Die Fundamental-Eigenschaften der Dioptrischen Instrumente." This book is widely read in Germany, where it has been adopted as a regular text-book in the schools. In 1880 Prof. Ferraris delivered before the Royal Accademia delle Scienze di Torino a memoir on "Telescopes having an Object Glass made up with Several Individual Lens at a Distance from each other," dealing with the peculiar properties of what is now known under the name of "Ferraris's Interstitial Determinant." In this memoir the theory of the anallatic telescope is extensively developed, and the invention of the shortened telescope is embodied. On electricity he has published several Papers, the most important ones dealing with the theory of the telephone. Among these is worth mentioning the memoir "On the Intensity of the Currents and Extra-Currents in the Telephone," which contains the results of one among the first measures on the current required to yield a perceptible sound in the telephone. (*See* "Atti dell' Accademia delle Scienze di Torino," 1878; *see also* G. Wiedemann's "Die Lehre von der Elektricität," Braunschweig, 1885, Vol. IV., p. 286.) The science of the technology of heat occupied the chief place in his regular course on Technical Physics to Engineers; and he has published on this subject a memoir, "On a Method for the Measure of the Water carried over Mechanically with Steam." (*See* the "Atti della Reale Accademia delle Scienze di Torino," 1881.)

In 1881 the International Electrical Exhibition at Paris, and the first International Electrical Congress held there, attracted the attention of Prof. Ferraris, as well as of many other physicists, towards electrotechnics, and urged him to devote himself mostly to this particular branch of applied physics, whose importance was growing every day. The Italian Government sent him as official delegate to this Congress, and to the International Conference on electric measurements held in 1882; and in 1883 he was appointed Italian Commissary to the Electric Exhibition in Vienna. In the following year he was the principal promoter and President of the International Electric Department in the General Italian Exhibition held in Turin. On that occasion Prof. Ferraris carried out his theoretical and experimental researches on the Gaulard and Gibbs transformers; these researches, as is well known, being amongst the earliest and most extensive on the scientific study of transformers. Prof. Ferraris, following this line of studies, made in 1885 several measurements on the Zipernowsky, Déry and Bláthy transformers of the close magnetic circuit type, and began to devote himself mainly to the study of the theory and application of alternating currents. He carried out, in August and September, 1885, his experiments on electrodynamic rotations by means of alternating currents; and he succeeded in demonstrating that it is possible to yield a rotating magnetic field by means of two alternating currents of the same period having a difference of phase, viz., how a uniform rotary movement can be generated with two alternating currents, and he constructed an alternating current motor which is asynchronous and does not need any commutator or collector. These results were given in a Paper delivered before the Royal Accademia delle Scienze di Torino on the 18th March, 1888 ("Atti della Reale Accademia di Torino," Vol. XXIII.), and have become widely known through the last developments of this class of apparatus. Prof. Ferraris carried out in 1886 a long theoretical and experimental research on alternating-current transformers, and he published his results in 1887 in the memoir, "On the Differences of the Phase of Currents, on the Lag of Induction, and on the Waste of Energy in Transformers," where was shown for the first time the relation existing between the difference of phase of the primary and secondary currents in a transformer, and the waste of energy due to hysteresis and eddy currents. The author has been able to draw from this relation a new method, which is made use of in this same series of experiments, for the measure of the energy delivered to the primary circuit by means of three electro-dynamometers. In 1886-87, Prof. Ferraris organised the Electrotechnic School for Engineers in Turin, which was the first of its kind to be opened in Italy. Later on this school was recognised as an official one by the authorities, and it is now supported by the Government. In 1889 an official commission was appointed from the Municipality of Frankfort-on-Main to make a series of experiments on alternating-current motors, and to answer several ques-

Digitized by Google

tions relating to the electric plant to be installed for the lighting of the city, Prof. Ferraris being a member of this Commission. He was a member of the International Board of Measurements at the Frankfort Electrical Exhibition in 1891, and was one of the vice-presidents of the Electrical Congress held in connection with that Exhibition. He was also the official representative of the Italian Government in the Chamber of Delegates, and was one of the vice-presidents of the International Electrical Congress at Chicago in 1893. Prof. Ferraris is a member of the R. Accademia delle Scienze di Torino; a Fellow of the R. Accademia di Agricoltura, a national member of the R. Accademia dei Lincei in Rome, of the Societa Italiana delle Scienze, and a corresponding member of the R. Istituto Veneto di Scienze, Lettere ed Arti, &c.

FITZ-GERALD, Desmond G., M.I.E.E. Born Feb. 21, 1834.

Having a great taste for scientific pursuits, and a distaste for official routine, Mr. Fitz-Gerald gave up his appointment in the War Office towards the end of 1861 in order to start *The Electrician* (old series), which was the first journal in which electrical applications, and especially submarine telegraphy, were discussed and advocated. This paper, upon which his principal *collaborateurs* were Mr. Owen Rowland, Mr. Richard Laming, and Mr. F. C. Webb, was continued under many difficulties and discouragements until May, 1864. It did much to forward the persevering and ultimately most successful attempts to lay an electric cable across the Atlantic. After that period Mr. Fitz-Gerald wrote frequent articles in the *Mechanics' Magazine*, the *Engineer*, and the *Electric Telegraph Review*, which paper was for a considerable period under his editorship. The direction of the science classes at the School of Telegraphy and Electrical Engineering was in his hands from the commencement until a few years ago, and many of the foremost among the rising generation of electricians received their first technical instruction from his lectures. He was one of the original members of the Society which has developed into the Institution of Electrical Engineers. Mr. Fitz-Gerald has given particular attention to electro-chemistry, including the study of the various forms of primary and secondary batteries.

FITZGERALD, George Francis, F.R.S., &c. Born in Dublin in 1851.

Prof. FitzGerald was educated at home and at Trinity College, Dublin. He took a Science Scholarship in 1870, and a University Studentship in 1871, graduating as B.A. 1871, and M.A. 1874. He obtained a Fellowship of Trinity College, Dublin, in 1877, and was afterwards appointed Erasmus Smith's Professor of Natural and Experimental Philosophy in the University of Dublin, 1881. He was Hon. Sec. of the Royal Dublin Society from 1881 to 1889. He was elected F.R.S. in 1883. He was President of Section A, British Association Bath Meeting, in 1888, and in the same year was appointed Examiner in Experimental Science at the London University. Prof. FitzGerald has published Papers on Electro-magnetic Theory in the *Transactions* of the Royal Society and in the *Transactions* of the Royal Dublin Society, as well as in the *Proceedings* of these Societies.

FLEMING, John Ambrose, M.A. (Cantab.), D.Sc. (Lond.), F.R.S. Born in Lancaster, Nov. 29, 1849; educated at University College School, London, University College, the Royal School of Mines, and St. John's College, Cambridge.

After an education at University College School and in University College, London, Mr. Fleming graduated Bachelor of Science at the University of London in 1870. From 1873 to 1874 he was Demonstrator in the Laboratories of the Royal College of Chemistry and private assistant to Dr. Frankland; and in 1874 he was appointed Lecturer on Physics and Chemistry at Cheltenham College. In 1877 Mr. Fleming entered Cambridge with the special object of working under the late Prof. Clerk Maxwell in the Cavendish Laboratory, Cambridge, in which place he carried out a long research, at Prof. Maxwell's instigation, comparing the existing British Association standards of electrical resistance, with the object of determining their differences at different temperatures and determining the mean British Association ohm. At St. John's College he obtained the Entrance Natural Science Exhibition, and was made Foundation Scholar in 1879, and also successively Hare Exhibitioner, Wright's Prizeman, and Hughes's Prizeman, this last being a special prize annually awarded to the Foundation Scholar most distinguished in mathematics and natural philosophy. He graduated Doctor of Science in the University of London in 1879. After taking the Cambridge M.A. degree, a first class with special honours in the Natural Science Tripos, he was appointed Demonstrator in Mechanism and Applied Science to the University of Cambridge, under Prof. James Stuart, and lectured on mechanism in the mechanical workshops. When University College, Nottingham, was opened as the centre for university teaching and technical education, Dr. Fleming was selected out of a large number of candidates as the first occupant of the Chair of Mathematics and Physics, but resigned the professorship after a short tenure to remove to London. On the formation of the Edison Electric Light Company he was appointed acting electrician; and on the amalgamation of the Edison and Swan Companies retained the position of advising electrician to the united company, which position he has since held. In 1883 he was elected a Fellow of St. John's College, Cambridge, and in 1884 a Fellow of University College, London. He is the author of many papers, which have appeared in various *Transactions* during the last few years. He is a member of the Physical Society, of the Royal Institution, a member of the Council of the Institution of Electrical Engineers, and a member of the British Association Committee for Determining Electrical Standards. In 1885 he was appointed the first occupant of the Chair of Electrical Engineering newly created in University College. Since then he has organ-

GEORGE FORBES.

Digitized by Google

ised a department of practical electrical engineering in University College, so that the regular college courses on physics and engineering are supplemented by practical instruction in this branch of technology. He designed all the interior arrangements of the new Electrical Laboratories in University College, London. He has published a course of lectures, entitled "Short Lectures to Electrical Artizans," the basis of which was a course of practical lectures delivered to the *employés* at Messrs. R. E. Crompton's works, Chelmsford, which has passed through four editions, and been widely read. Between 1889 and 1891 he published the first and second volumes of a treatise on the "Alternate Current Transformer," which forms part of *The Electrician* Series of Scientific Publications, and which has run through many issues and become the standard treatise on the subject. In 1892 he was elected a Fellow of the Royal Society. He has frequently lectured at the Royal Institution and the Society of Arts, and has contributed many Papers to the *Transactions* of the Physical Society, Royal Society, Institution of Electrical Engineers, British Association, and other technical societies. In addition to holding the position of permanent scientific adviser to several corporations he practises as a consulting electrical engineer, and in this capacity acts as scientific adviser to many firms, corporations, and electrical companies in matters connected with patent investigations, arbitrations, and electrical expert work generally. As a lecturer he is well known, having given courses of Gilchrist and Cantor Lectures, and has taken a considerable practical interest in the subject of popular and technical education.

FORBES, Prof. George, is the son of James David Forbes, D.C.L., LL.D., F.R.S., &c., Professor of Natural Philosophy at Edinburgh University, and afterwards Principal of St. Andrew's University, who was son of Sir William Forbes, seventh baronet, of Pitsligo, the friend of Sir Walter Scott.

The subject of our sketch was educated at St. Andrew's and Cambridge Universities; at the former institution he twice won the Grey prize for essays on solar physics and on meteors and shooting stars, and at the latter he took degree with mathematical honours. After leaving Cambridge, Prof. Forbes spent a year in Prof. Tait's laboratory at Edinburgh. He was elected Professor of Natural Philosophy at Anderson's College, Glasgow, at the age of 23, and remained there from 1872 to 1880. In 1874 he went out in command of the Government expedition to Hawaii, to set up observatories, determine the longitude, and observe the transit of Venus; he went out by way of the Straits of Magellan, and after spending six months on the islands he returned by way of San Francisco, Japan, China, Siberia, and St. Petersburg. In 1877, during the long Scotch Vacation, he acted as special correspondent to *The Times* in the Russo-Turkish War, and was the only Englishman who gained access to the Russian camps in Asia. In 1881 he became manager of the British Electric Light Company, and worked the Gramme dynamo and Lane-Fox incandescent lamp, starting the first central station for electric light in London. In 1882 he commenced to practise as consulting engineer in Westminster. In addition to his travels mentioned above, Prof. Forbes has been much on the Continent, and has paid several visits to the United States. He is a Fellow of the Royal Society, of the Royal Society of Edinburgh, of the Royal Astronomical Society, and of the Allgemeine Astronomische Gesellschaft, a Vice-President of the Institution of Electrical Engineers, and is also a Member of the Institution of Civil Engineers, of the American Philosophical Society, and of the Société Internationale des Electriciens, and an Honorary Member of the Franklin Institute. In 1881 he was made a Chevalier of the Legion of Honour. He has acted as consulting engineer to several of the largest electric lighting companies in London and elsewhere, also to the Vestry of Paddington and other local authorities; and in May, 1892, was appointed consulting electrical engineer to the Cataract Construction Company of New York, formed for the purpose of utilising the water-power of the Falls of Niagara. Prof. Forbes' most important inventions include a fire-damp indicator; a dynamo for large currents; an electric current meter; carbon brushes for dynamos and motors; the ironclad dynamo, with the exciting coils round the armature instead of round the field magnets; an underground system of conductors; and a destructor for city refuse, suitable for obtaining steam power for the electric light. He has found time in the course of an extremely busy career to publish works on "The Transits of Venus," "Rendu's Theory of Glaciers," and reprinted "Lectures on Electricity"; and to contribute the following writings on electrical subjects (amongst many others) to the publications mentioned:—*B. A. Reports:* "On Certain Connections between the Molecular Properties of Metals" (1873), "On an Electrical Gyrostat" (1879), "On the Diameters of Wires Required for Different Electric Currents without Overheating," and "On a New Arc Lamp" (1882). *Proc. Royal Soc., Edin.:* "On Diamagnetic Rotation" and "On the Theory of the Telephone" (Vol. IX., 1875-1878), "On Transmission of Power by Alternate Currents' (1883). *Proc. Royal Soc.:* "A Sensitive Form of Thermopile" (1886) and "A New Telephone Transmitter" (1887). In the *Journal of the Society of Telegraph Engineers:* "On the Proper Dimensions of Wires to Carry Electric Currents without Overheating" (1884), "Remarks on a Paper by Mr. Kapp (1886), showing how to Calculate Magnetic Leakage in Dynamos," and "Some Electric Lighting Central Stations in Europe and their Lessons" (1889). *Journal of the Society of Arts:* "Electricity as a Motive Power" (1884), "Cantor Lectures on the Distribution of Electricity" (1885), "On the Distribution of Electricity" (1886), "Six Lectures on Electricity" (1887), "Cantor Lectures on Developments of Electrical Distribution "(1892). *Times:* Long series of Letters on the Paris Electrical Exhibition (1881). Prof. Forbes has, in addition, written many Papers on astronomical and cognate subjects.

FRÖLICH, Oscar, Ph.D., was born in 1843, at Berne, Switzerland, and studied physics and mathematics at the Universities of Berne and Königsberg, Prussia, at which latter place he was pupil of Prof. F. E. Neumann, the author of "The Law of Electric Induction."

In 1868, Dr. Frölich was Privat docent at the University of Berne; from 1869 till 1873 he taught physics and mathematics at the Agricultural and Forest Academy of Hohenheim; in 1873 he entered the establishment of Siemens and Halske of Berlin, where he still holds the post of chief electrician and director of the laboratory. He has written a treatise on Electricity and Magnetism (a second edition of which was published in 1887), and "The Dynamo Machine, a Physical Description" (1886, French translation 1887). His principal Papers treat of the temperature of the earth, of the temperature of the interplanetary space, the variations of the heat of the sun, the theory of the dynamo machine, the universal Wheatstone Bridge, and optical demonstrations of the movement of the telephone, and of alternate-current waves.

FULLER, Thomas, F.R.G.S., was born in 1832, and was educated at Caius College, Cambridge.

Mr. Fuller is Managing Director of the Brazilian Submarine Telegraph and African Direct Telegraph Companies, and is a Director of the West African, the Pacific and European, and the Europe and Azores Telegraph Companies. Mr. Fuller is an Officer of the Brazilian Order of the Rose, and Commander of the Orders of Conception and Christ of Portugal.

GARCKE, Emile, was born in Germany in 1856, but has since been naturalised as a British subject.

Mr. Garcke commenced his business career at the age of 18, when he became assistant to the secretary of the London and Provincial Bank, and he has since been associated in various capacities with a number of industrial concerns in England and on the Continent, having had a very extensive experience in the administration of joint-stock companies. He became connected with the electrical industry in 1883, when he was appointed secretary of the Anglo-American Brush Electric Light Corporation. During the following ten years he was closely identified with the progress of the Brush Company, and it would be difficult to sketch his subsequent career without at the same time describing the history of that Company. In 1887 Mr. Garcke was appointed manager as well as secretary; and in January, 1891, he was appointed Managing Director. In 1892 he resigned this executive position, and was appointed to a seat on the Board. While with the Brush Co. he personally superintended their Continental business, and besides conducting the successful negotiations for the sale of their central station at Temesvar to the municipality, he directed the policy of the Vienna firm of Kremenezky, Mayer and Co., which now ranks as one of the leading electrical businesses in Austria. Last year he was offered the position of Managing Director of the Electric Construction Corporation, and upon accepting the same he resigned his seat at the Board of the Brush Company. Since his appointment the Electric Construction Corporation has been "re-constructed," and a complete reorganisation of the business has been carried out. Mr. Garcke has likewise been associated with other electrical movements. He was hon. secretary to Lord Thurlow's Electric Lighting Act Committee until the passing of the Amendment Act in 1888; and was instrumental with Mr. Crompton and others in forming the Electrical Section of the London Chamber of Commerce, of which he is now vice-chairman, and during the past year he organised the special Electric Traction Committee of the Chamber. The Committee prepared evidence submitted to the Joint Committee of both Houses of Parliament on the telephone question, and was instrumental in obtaining a very important amendment of the law in favour of electric traction. He is an original Director, and now Managing Director, of the Electric and General Investment Company, Director of the Chelsea Electricity Supply Company, of the Oxford Electric Company, of the Crystal Palace District Electric Supply Company, and of other electrical companies. He is a Fellow of the Royal Statistical Society, member of the Institute of Electrical Engineers, of the Institute of Actuaries, of the Society of Arts, and of other societies In conjunction with Mr. J. M. Fells he has written a book on "Factory Accounts; their Principles and Practice," which has been published both in England and in America, and has passed through several editions.

GARNETT, William.

Prof. Garnett was Demonstrator of Physics in the University of Cambridge during the tenure of the Professorship by the late Prof. James Clerk Maxwell, and was afterwards Lecturer on Physics in St. John's College, of which he was for some time a Fellow. He was subsequently Professor of Mathematics, Physics, and Mechanics in University College, Nottingham, and electrician to the Corporation of that borough. He was afterwards appointed Principal of the Durham College of Science, and whilst holding this appointment the new buildings of the College were provided with a very complete physical laboratory in which the electrical testing room is a special feature. As Chairman of the Electric Lighting Committee of the Royal Jubilee Exhibition at Newcastle-on-Tyne, of the Executive Council of which he was a member, he acted as hon. electrician to the Exhibition. In July, 1893, Principal Garnett was appointed Educational Adviser and Secretary to the Technical Educational Board of the London County Council, the committee to which the Council has delegated all its powers under the Technical Instructions Acts, and he is now engaged in endeavouring to organise a system of technical education for London which shall lead from the public elementary schools to the technical colleges and equip the students for industrial pursuits.

GAVEY, John, M.I.E.E., was born in Jersey, August 11, 1842, educated at Victoria College, Jersey, and entered the service of the late Electric and International Telegraph Company in 1860.

In 1870, on the transfer of the telegraphs to the State, Mr. Gavey was appointed superintendent of the South-Eastern, and subsequently of the Great Western Sub-Division of the Southern Division of England, of which Mr. Preece was divisional engineer. In 1878 he became superintending engineer of the South Wales district of telegraphs, and in November, 1892, he was appointed Chief Technical Officer at the General Post Office, London. Mr. Gavey has contributed occasional Papers to the Society of Telegraph-Engineers, the Naturalists' Society of Cardiff, and to the professional journals. During a lengthy residence at Cardiff he took an active part in promoting the scientific and literary progress of the town, and served on the Free Library, Museum, and Technical Education Committees; but his principal work has been of a departmental character.

GEE, William Winson Haldane, B.Sc. (Lond.), F.C.S. Born near Bolton (Lancashire), 1857.

Mr. Haldane Gee was educated at the Manchester Grammar School, the Royal College of Science, and Owens College. He has held the position of Science Master at the Preston and Macclesfield Grammar Schools, and Science Lecturer at the Useful Knowledge Society, Macclesfield, the Harris Institute, Preston, and the Technical School, Manchester. In 1881 he was appointed Demonstrator in Physics at Owens College, Manchester, under the late Professor Balfour Stewart. In conjunction with Professor Stewart he has published three volumes on Practical Physics: Vol. I., "General Physical Processes" (1885), Vol. II., "Electricity and Magnetism" (1887), and Vol. I. of a "School Course of Practical Physics (Electricity and Magnetism)" (1888). He has published a number of original Papers relating to general and chemical physics, and is especially interested in the scientific and technical developments of electro-chemistry. He has taken part in the development of the teaching of practical physics, has designed a number of physical laboratories, and has for many years been engaged in teaching electrical technology. In June, 1891, he was appointed Chief Lecturer in Physics and Electrical Engineering at the Manchester Municipal Technical School. The Central Technical School in Princes-street being already overcrowded, it was decided to open a new branch of the School in a large warehouse in Whitworth-street, which has been fitted up for physical and electro-technical teaching. Already 300 day and evening students are attending the lectures or working in the laboratories, so that this new Electrical Engineering School promises to have an important relation to the electrical industries of Manchester and district. Mr. Gee is one of the Extension Lecturers of the Victoria University, and in this capacity has lectured on "Electricity and its Technical Applications" at various places. He has also lectured to the Fire Institute of Manchester and the Fire Association of Manchester on "Fire Risks of Electric Lighting."

GEIPEL, Wm., M.I.E.E. Born 1860; was educated at Bristol Grammar School and at the College of Physical Science, Newcastle-on-Tyne. He passed the Oxford Local Examination in 1876, and the City Guilds Examination in Electric Lighting and Engineering in 1882, in both of which he obtained first-class honours.

Mr. Geipel served a four years' apprenticeship in the workshops and drawing offices as a mechanical engineer, at the well-known marine engine works of Messrs. T. Richardson and Sons, of Hartlepool, and was also six months at Hebburn Collieries, county Durham, studying mining engineering. Subsequently he was with a firm of civil engineers in the City of London, by whom he was engaged on several important works, and whom he left to enter the service of the Anglo-American Brush Corporation in 1882. Shortly afterwards he was appointed assistant manager at their Dynamo Works in Borough-road. In 1884 he was sent by them to Edinburgh to superintend the lighting of the Forestry Exhibition, which was exclusively carried out by the Corporation under his supervision to the entire satisfaction of the committee. Subsequently, Mr. Geipel negotiated and carried out for the Brush Company a large number of electric light installations in England and Scotland, and opened branch offices in Edinburgh and Glasgow, which were under his charge, as the Company's superintendent for Scotland, up to 1889. Upon the formation of the Scottish Electric Supply Company Mr. Geipel became one of the Directors. In 1889, owing to the rapid development of their business in the lighting of towns, the Brush Company found it necessary to appoint a central station engineer, and selected Mr. Geipel for the post, in which capacity he had control of the designing, working, and equipment of the Brush Company's central stations in this and other countries. Upon the re-arrangement of the Brush Company's staff in 1892 he was appointed their superintending engineer, which appointment he still holds. For two years previous to his leaving Edinburgh he also held an appointment at the new Heriot-Watt College as lecturer in Electrical Engineering. Mr. Geipel is an occasional contributor to the columns of *The Electrician*, and at the annual meeting of the Institution of Mechanical Engineers in London, 1888, read a Paper on "The Position and Prospects of Electricity as Applied to Engineering," which was published in the leading electrical and engineering journals in this and other countries. He is one of the authors of Geipel and Kilgour's "Electrical Engineering Formulæ," one of *The Electrician* Series of Standard Scientific Works.

GENT, John Thos. Born at Leicester, 1841.

Served an apprenticeship with a mechanician of the same town, and soon afterwards entered the service of Mr. Smeeton, electrical con-

Digitized by Google

tractor, of Halifax, Yorkshire. In 1864 he became private electrical assistant to Mr. L. J. Crossley, of Willow Hall, Halifax, remaining there nearly two years, and after leaving Mr. Crossley commenced business in Halifax, shortly afterwards joining in partnership with Mr. Blakey, of the present firm of Blakey, Emmott and Co. After dissolving partnership with Mr. Blakey he came to Leicester and entered into business as a wholesale electrician. He published a "Manual of Electric Bell Fixing," which had a large sale and did much to popularise this branch of the trade. When electric bells for domestic purposes came before the public in a practical form, Mr. Gent was one of the very few who pioneered what has since become an enormous and profitable business. He invented a new system of "drop" indicators, and shortly afterwards introduced a novelty in electro-pneumatic bells, followed by an entirely new system of mechanical pneumatic bells, all of which he protected by patents. In 1875 he introduced the "knife-edge" form of swinging pendulum signals, which has since been almost universally adopted. Shortly afterwards he invented a watchman's clock, which received the approval of Her Majesty's Commissioners in Lunacy, and has been adopted in many of the largest asylums in the country. In 1881 he brought out and patented an excellent combined microphone and telephone, which promised a large sale, but owing to the action of the United Telephone Company its manufacture had to be abandoned. Since the expiry of the Edison patent, however, it has been resumed with remarkable success. Within a recent period, Mr. Gent has, in conjunction with his partners, taken out several important patents, amongst them being a watchman's clock, marking in fluid ink, also an "electrical fire-damp detector" for mines, which is portable, and will automatically indicate as little as a half per cent. of gas, and which has been highly reported upon by mining experts.

GERARD, Eric. Born at Liége, September 22, 1856.

In 1878 he left the University of Liége with the honorary degrees of Ingénieur des Mines and Ingénieur des Arts et Manufactures, and completed his electrical studies at the Ecole Superieur de Télégraphie. He then became engineer in the Belgian State Telegraph Service, and in 1883 was called upon to take charge of an electro-technical institute which had been founded in connection with the Liége University. This institute is due to the princely gifts of M. Montefiore, a Senator, and is intended to educate electrical engineers. Since 1891 this Institute has possessed a building of which Prof. Ayrton said in his Presidential Address to the Institution of Electrical Engineers in 1892: "When I tell you that there are rooms for small direct-current dynamos, separate rooms for large direct-current dynamos, separate rooms for alternators, and that every three students have a separate little laboratory, with the necessary measuring instruments, all to themselves, your educational mouths will water, as mine did." Prof. Gerard is the author of "Eléments d'Électrotechnique," which has been translated into German; of "Leçons sur l'Electricité" (two editions of which have been issued in less than a year); and of several memoirs on the instruction and practical measurement of electricity. Prof. Gerard has had several flattering offers to manage industrial concerns, but he has preferred to continue in his educational career and to practise as a consulting engineer. He is a Chevalier of the Legion of Honour, of the Iron Crown, and several other orders.

GERHARDI, Charles A. Born 1837, and has been connected with telegraphy since 1854.

Mr. Gerhardi was engaged in the first Atlantic cable expeditions in 1857 and 1858; and has been manager of the Direct Spanish Telegraph Company since its formation in 1872. He has been a member of the Institution of Electrical Engineers since 1874, and represented the Direct Spanish Company at the International Telegraph Conferences of London in 1879, of Berlin in 1885, and of Paris in 1890.

GLADSTONE, John Hall, Ph.D., D.Sc., F.R.S. Born March 7, 1827, and educated at home.

In the year 1844 Mr. Gladstone began the study of science under Prof. Graham at University College, London. Afterwards he went to the University of Giessen to study chemistry under Baron Liebig, and in 1848 he took the degree of Ph.D. there. He lectured on chemistry at St. Thomas's Hospital from 1850 to 1853, at the same time conducting original researches. Most of these early investigations were on explosives and phosphorus compounds, and in recognition of their merit the author was in 1853 elected to the Fellowship of the Royal Society. Being then only 26, he enjoys the distinction of having been one of the youngest Fellows ever elected. While serving on a Royal Commission on Lighthouses in 1859, he had occasion to report on the magneto-electric light. In 1869 a Paper on "Refraction Equivalents of the Elements" appeared in the *Phil. Trans.*, forming a sequel to his research with the Rev. T. Pelham Dale on the "Refraction, Dispersion, and Sensitiveness of Liquids," which had been published in the *Phil. Trans.* for 1863. The permanence of the specific refractive energy of a body, notwithstanding any changes of temperature, aggregate condition, solution, or even chemical combination, having been established, the doctrine of refraction equivalents naturally followed. In 1861, 1872, and 1886 he read to the Chemical Society papers on essential oils. Dr. Gladstone was appointed Fullerian Professor of Chemistry at the Royal Institution in 1874, and filled the Chair until 1877. In 1874 he chose the "Voltaic Battery" as the subject of the Juvenile Lectures. In 1875 he delivered five lectures on chemical force, in the fifth of which he dealt with "The Copper-Zinc Couple and its Effects," pointing out the importance of the couple formed by the deposition of copper

Digitized by Google

in arborescent crystals upon zinc, both from an electric and a chemical point of view. Dr. Gladstone, in conjunction with the late Mr. Tribe, performed many interesting experiments with it between 1872 and 1874, the experiments resulting in the discovery of several new substances. At the same time they described an "Air Battery," one in which the oxygen of the air takes part. In 1877 he gave a discourse to the Institution on the "Influence of Chemical Constitution on the Refraction of Light." In the spring of 1868, the number of chemical elements of which the refraction equivalent had been determined was 17, a number which in 1877 had been increased to 52. During 1878 and 1879 Dr. Gladstone's most important researches were concerned with the copper-zinc couple. The *Journal* of the Chemical Society for the former year contains a paper on "Analogies between the Action of the Copper-Zinc Couple and of Occluded and Nascent Hydrogen," and that for 1879 a continuation of the research. More recently its action on benzoyl compounds has been investigated. In 1880, again in conjunction with Mr. Tribe, he published a paper on "The Aluminium Iodine Reaction" in the *Proceedings* of the Royal Society. This process has given us a number of aluminium alcohols, and some curious products of their decomposition by heat. They subsequently published a Paper on "Thermal Electrolysis," and a small book on "The Chemistry of the Secondary Batteries of Planté and Faure." Dr. Gladstone has extended his consideration of refraction of light to another series of constants, namely, dispersion-equivalents, and, together with Dr. W. H. Perkin, has shown the connection between the phenomena of refraction, dispersion, and the magnetic rotation of light passing through liquid compounds. In conjunction with Mr. Walter Hibbert he has also made contributions to the British Association Committee on Electrolysis, and has sent various additional notes on Secondary Batteries to the *Phil. Mag.* In 1892 Dr. Gladstone and Mr. Hibbert communicated to the Institution of Electrical Engineers a Paper on "The Cause of the Changes of Electromotive Force in Secondary Batteries," in which they show the great influence of the strength of the sulphuric acid that is against the working surfaces of the plates. Dr. Gladstone was President of the Physical Society from its formation in 1874 to 1876, President of the Chemical Society from 1877 to 1879, and also President of the Education Society in 1880 and 1881. In his capacity as Member of the London School Board for the last twenty years he has done a good deal in promoting instruction in elementary physics and other branches of science.

GOOLDEN, Walter T., M.A., Fellow of the Physical Society. Born in 1848; educated at Magdalen College, Oxford; Science Scholar of Merton College, 1867; First Class in Natural Science, 1871.

Mr. Goolden is Examiner to the Civil Service Commission; Assistant Examiner in Natural Philosophy to the University of London from 1883 to 1887, and to the Science and Art Department, South Kensington, since 1871; and is a member of the firm of Messrs. W. T. Goolden and Co.

GORE, George, LL.D. (Edin.), F.R.S. Elected a Fellow of the Royal Society 1865. Was Lecturer on Physics and Chemistry during many years in King Edward's School, Birmingham.

Chiefly known as an electro-metallurgical chemist, and as an experimental investigator in chemistry, electro-chemistry, and voltaic electricity. He is the author of several books, viz., "The Art of Scientific Discovery"; "The Principles and Practice of Electro-Deposition"; "The Art of Electro-Metallurgy"; "Electro-Chemistry"; "The Scientific Basis of National Progress;" and "The Art of Electrolytic Separation of Metals" (this latter, and "Electro-Chemistry," belonging to *The Electrician* Series of Standard Scientific Works). We give the titles of his chief electrical investigations. Many of his experimental researches have been published in the *Proceedings and Transactions* of the Royal Society, and are well known. Amongst them are the following:—"Properties of Electro-Deposited Antimony" (1857, 1858, 1862); "Electro-Torsion" (twisting iron rods by means of electric currents, 1874); "Movements of Liquid Metals and Electrolytes in the Voltaic Circuit" (1860); "Production of Vibrations and Sounds by Electrolysis" (1861, 1862) "Development of Electric Currents by Magnetism and Heat" (1869); "Thermo-Electric Properties of Liquids and Metals" (1871); "Attractions of Magnets and Electric Conductors" (1874); "Rotations of Bar-Magnets and Conducting Wires on their Axes" (1875); "Thermo-Electric Properties of Liquids" (1878); "Chemico-Electric Relations of Metals in Solutions of Salts of Potassium" (1879); "Thermo-Electric Behaviour of Aqueous Solutions with Mercurial Electrodes" (1879); "Thermo-Electric Behaviour of Aqueous Solutions with Platinum Electrodes" (1881); "The Capillary Electroscope" (1880, 1881, 1882); "Effects of Electric Currents on Surfaces of Mutual Contact of Liquids" (1880); "Electric Currents caused by Liquid Diffusion and Osmose" (1881); "Influence of Voltaic Currents on Diffusion of Liquids" (1881, 1882); "Experiments on Electric Osmose" (1881); "Electrolytic Diffusion of Liquids" (1881); "Some Effects of Passing Electric Currents through Magnetised Electrolytes" (1881); "Relations of Heat to Voltaic and Thermo-Electric Action of Metals in Electrolytes" (1883, 1884); "Some Relations of Chemical Corrosion of Metals to Voltaic Currents" (1883); "Some New Phenomena of Electrolysis" (1884); "Unequal Electric-Conduction-Resistance at Cathodes" (1884); "On 'Transfer-Resistance' in Electrolytic and Voltaic Cells" (1885); "Relation of 'Transfer-Resistance' to Molecular Weight and Chemical Composition of Electrolytes" (1836); "Effects of Chlorine on the Electromotive Force of a Voltaic Couple" (1888); "Minimum Point of Change of Potential of a Voltaic Couple" (1888); "Change of Potential of a Voltaic Couple by Variation of Strengths of its Liquid"

Digitized by Google

(1888); "Influence of Chemical Energy of Electrolytes upon the Change of Potential of a Voltaic Couple" (1888); "Effects of Different Positive Metals upon the Changes of Potential of Voltaic Couples" (1888).

In the *Proceedings* of the Birmingham Philosophical Society:—"On the Electrolysis of Sulphate of Copper" (1882); "The Electrolytic Balance of Chemical Corrosion" (1882); "Chemical Corrosion of Cathodes" (1882); "An Improved Thermo-Electric Pile for Measuring Small Electromotive Forces" (1883); "Electro-Deposition of Carbon" (1883); "Electrolysis of Fluoride, Chlorate, and Perchlorate of Silver" (1883); "On a Peculiar Class of Chemico-Electric Currents" (1884); "Influence of External Resistance on the Internal Resistance of Voltaic Cells" (1884); "Apparatus for Showing the Electro-Magnetic Rotation of Electrolytes" (1884); "On 'Resistance' at the Surfaces of Electrodes in Electrolytic Cells" (1885); "Evidence Respecting the Reality of 'Transfer-Resistance' in Electrolytic Cells" (1885); "A New Solution for the Electro Deposition of Metals" (1885); "Relations of 'Surface-Resistance' at Electrodes to Various Electric Phenomena" (1885); "Electrolysis of Alcoholic and Ethereal Solutions of Metallic Salts" (1887); "Relations of 'Transfer-Resistance' to the Molecular Weight and Chemical Composition of Electrolytes" (1887).

In the *Philosophical Magazine*:—"Production of Electric Currents by Unequally Treated Metals in Liquids" (1857); "Rotation of Metallic Tubes and Spheres by Electricity" (1858, 1859); "Apparatus for Examining the Electrical Relations of Mercury in Electrolytes" (1859); "Electrical Relations of Metals in Fused Substances" (1864); "Relation of Mechanical Strain to Magneto-Electric Induction" (1868); "Magnetism of Electro-Dynamic Spirals" (1870).

In the *Pharmaceutical Journal*:—"Electrical Relations of Iron and Copper in Electrolytes" (1853); "Ditto of Iron and Tin" (1856); "Ditto of Lead and Antimony" (1856); "Position of Aluminium in the Thermo-Electric Series" (1856); "Ditto of Sodium" (1856).

He has also made various chemical and physical researches, including: "Properties of Liquefied Carbonic Acid" (*Phil. Trans.* Roy. Soc., 1861); "On Hydro-Fluoric Acid" (*ibid.*, 1869); "Fluoride of Silver" (*ibid.*, 1870, 1871); "Liquefied Hydrochloric Acid Gas" (*Proc.* Roy. Soc., 1865); "Momentary Molecular Change in Iron at a Red Heat" (*ibid.*, 1869); "On Liquefied Cyanogen Gas" (*ibid.*, 1872); "Anhydrous Liquefied Ammonia Gas" (*ibid.*, 1872, 1873); Rotation of Hollow Spheres of Metal by Heat" (*Phil. Mag.*, 1859); "Molecular Movements and Magnetic Changes in Iron at Different Temperatures" (*ibid.*, 1870); and other researches.

Amongst the most recent of his published researches is one on "The Voltaic Balance" (see *The Electrician*, Vol. XXI., p. 337, and Vol. XXIII., p. 171), by means of which has been detected the voltaic energy of one part by weight of chlorine in 500,000 million parts of water (*Proc.* Roy. Soc., Vol. XLIV., p. 151); "A New Method and Department of Chemical Research" (*Phil. Mag.*, May, 1890); "A Method of Measuring Loss of Energy Due to Chemical Union of Electrolytes, &c.' (*Phil. Mag.*, Jan., 1892); and "A General Relation of Electromotive Force to Molecular Velocity" (*Proc.* Birm. Phil. Soc., 1892).

GRAVES, A., M.I.E.E. Born 1838. Connected with the Electric Telegraph Company at York, in various capacities, from 1852 until 1869.

Mr. Graves has been the telegraph superintendent of the North-Eastern Railway Company since January, 1870. He was the first to use, and to advocate the use of, copper wire for overhead telegraph lines.

GRAVES, James, M.I.E.E., F.I.Inst. Born at Chesterton, near Cambridge, August 4, 1833, and educated at Cambridge till 1844.

Mr. Graves studied with and assisted his father at Meppershall, Bedfordshire, until 1848, when the latter removed to Kent, having been appointed master of the school at Hoo, St. Werburgh, near Rochester. In 1850 Mr. Graves was appointed by the Rev. Thomas Dale as assistant master at St. Pancras National School, Euston-square, London. On 26th December, 1852, he entered the service of the Electric Telegraph Company, Founders'-court, Lothbury, and was transferred in February, 1853, to the Southampton Station. In 1857 he was, at Mr. C. F. Varley's request, removed from Southampton to the Foreign Gallery at Lothbury, London, whence he was, in 1858, transferred to the Jersey Station of the Channel Islands Telegraph Company. He remained in charge of that station, until, at Mr. C. F. Varley's request, he undertook, in 1861, the duties of submarine electrician to the Electric and International Telegraph Company's steamer "Monarch." During 1862 and 1863 he acted as Mr. Varley's travelling assistant, fixed the Newcastle time-gun apparatus, visited South Wales and Ireland, introducing to the district superintendents Mr. Varley's universal galvanometer, and the system of daily tests of the land wires in those districts. When the Atlantic telegraph scheme was revived in 1864 he was lent to the Atlantic Telegraph Company to test the cable during its manufacture and shipment, as Mr. Varley's representative, that gentleman having been appointed as the chief electrician to the Atlantic Company. Upon the sailing of the 1865 Expedition, Mr. Graves was appointed their superintendent at Valentia by the Atlantic Telegraph Company, which appointment was renewed when the 1866 Expedition proved successful, and the working of the cables was taken up by the Anglo-American Telegraph Company. From June to October, 1870, Mr. Graves acted as electrician to the Anglo-American Telegraph Company's steamer "Robert Lowe" during the repairs of the 1866 cable off Newfoundland, and of the French Atlantic cable off Cape Sable, Nova Scotia; and in June and July, 1874, he acted in a similar capacity on board

Digitized by Google

the s.s. "Minia" during the repair of the 1866 cable off Valentia. In 1879, in conjunction with Mr. J. B. Stearns, he succeeded in establishing duplex working upon the 1874 Anglo-American cable, and has since applied Mr. Stearns' system of duplex working to the 1873 and 1880 cables belonging to that company. In 1882, when the German Union Telegraph Company laid their cable from Valentia to Emden, North Germany, Mr. Graves was appointed to the superintendentship of the German Union Company, jointly with that of the Anglo-American Company. On January 1, 1889, the German Government took over the working of the Emden cable, retaining Mr. Graves in the same position as he held under the German Union Company, which appointment he still holds. Mr. Graves has contributed several Papers to the Institution of Electrical Engineers, amongst which those on "Earth Currents," on "Vibrations due to Earth Plates," and on "Curbed Signals for Long Cables," attracted much attention. He has been a member of the Institution since its formation in 1872. He was elected a member of the Society of Arts in 1874, is a Membre Fondateur of the Société Internationale des Electriciens, and a Fellow of the Imperial Institute.

GRAY, Prof. Andrew, was born at Lochgelly, Fifeshire, in 1847; and received his early education in that place. Thence he proceeded to Edinburgh, and attended classes at the Watt Institution and School of Arts (now the Heriott Watt College), gaining the Bryson prize for Mathematics and an exhibition of £25 presented to the Institution by Sir Joseph Whitworth.

Mr. Gray afterwards entered at the University of Glasgow, and graduated Master of Arts, gaining at the same time the Eglinton Fellowship for proficiency in Mathematics and Natural Philosophy. In the second year of his course there he was nominated by Sir William Thomson (Lord Kelvin) to an experimental scholarship in Electricity and Magnetism given by Mr. Heugh, of Tunbridge Wells, to the Andersonian University, Glasgow. This he held for two sessions, when he was asked by Sir William Thomson to become his private secretary and experimental assistant. While serving in this capacity Mr. Gray had, for a short time, as a fellow student Prof. John Perry, and assisted with his brother (Mr. T. Gray) in the carrying out of the greater part of Sir William Thomson's researches on the "Effects of Stress on Magnetisation." This post Mr. Gray held until 1880, when he had the honour of being invited by Sir William Thomson, as Professor of Natural Philosophy in the University of Glasgow, to accept the higher post of his official assistant. In 1884, on the foundation of the University College of North Wales at Bangor, Mr. Gray was appointed Professor of Physics in that institution, and that post he still holds. In 1892 Mr. Gray contributed a series of articles to *Nature* on "Electrical Measurement," which were reprinted, with additions, in a small book entitled "Absolute Measurements in Electricity and Magnetism," which was published by Macmillan and Co. in 1884. This work was rapidly sold out, and a new edition was called for at the beginning of 1885, when also it was reprinted in French in *La Lumière Électrique*. It was, however, decided to extend the scope of the work so as to include a fairly complete account of the determinations of electrical and magnetic constants made since the Absolute System of Units was founded. This task proved a very laborious one, and occupied the author until the end of 1892, when the work was completed by the issue of Vol. II. in two parts containing "Magnetism" and "Electromagnetism." The delay caused by the vast amount of Papers to be read and digested, however, enabled the author to include in the second volume accounts of recent magnetic research, and Hertz's experimental verification of Maxwell's "Electromagnetic Theory of Light." In 1889, at the request of the publishers, who had been advised that the original book had proved useful to students of practical electricity, it was decided to recast that work and issue a second edition, without seriously adding to the number of topics discussed in it. The book was, however, in great part rewritten, and augmented in the process to twice its original size, and was published in 1889. Besides these works Prof. Gray is the author of several Papers on electric and magnetic subjects, some of them in conjunction with his brother, Prof. Thomas Gray, now of Terre Haute, U.S.A. He is at present engaged on a systematic treatise on magnetism and electricity, in which an attempt will be made to present the whole subject from the point of view of action in the electromagnetic field. Prof. Gray is a Fellow of the Royal Society of Edinburgh, and a Member of the Physical Society. He is also, at present Examiner in Mathematics and Natural Philosophy for Degrees in Arts in the University of Glasgow, and in Physics for Degrees in Medicine in the same University.

GRAY, Elisha. Born at Barnsville, Ohio, U.S.A., August 2, 1835.

When a lad Prof. Gray was apprenticed first to a blacksmith, and subsequently to a carpenter and boat-builder. Upon the completion of his several apprenticeships he entered Oberlin College, and made a special study of physical science, supporting himself meanwhile by working at his trade. In 1867 Prof. Gray obtained his first patent for telegraphic apparatus—a self-adjusting relay. Since that time he has taken out nearly 50 patents, the most important relating to his printing-telegraph system, which was largely in use before the advent of the telephone, the harmonic telegraph, the telephone, and the telautograph. All of Prof. Gray's inventions bear the stamp of thorough originality, and in no sense can he be called an adapter of ideas furnished by others. He was the first to transmit several messages simultaneously over a wire on the harmonic plan, and his famous caveat of February 14, 1876, contains the first written description of the speaking telephone. The first speech transmitted over a wire was with instruments similar to those described in

Digitized by Google

that caveat. Prof. Gray has been occupying himself for some years past with his telautograph, or writing telegraph, and in this wonderful invention he again displays remarkable genius and individuality. His laboratory is at Highland Park, Ill., where he resides. He is a member of the faculty of Oberlin College, and in 1878 was honoured at the Paris Exhibition with the red ribbon of the Legion of Honour.

GREENER, John Henry, M.I.E.E., C.E. Born at Etherly, county Durham.

In 1843 Mr. Greener began his career in London on the Blackwall Railway, and was there first connected with the electric telegraph. In 1847 he entered the service of the old Electric Telegraph Company. In 1849 Mr. Greener returned to the Blackwall Railway in charge of the telegraphs, and in 1853 rejoined the Electric Telegraph Company, Mr. Edwin Clark being then engineer. The same year he was appointed by the company to proceed to Norway to construct the telegraph on the Norwegian Trunk Railway, which was at this time being made. This was the first line of telegraph erected in Norway. In 1855 he went to Denmark to construct the telegraph on the Royal Danish Railways. Shortly after his return from Denmark, Mr. Greener was appointed by the Telegraph Company to proceed to Ireland, to report on the state of the telegraph lines between Dublin and Galway, for the purpose of establishing direct communication with the Atlantic cable. He was afterwards appointed by the Telegraph Company as outdoor assistant to Mr. Latimer Clark (then engineer to the company), which position Mr. Greener held until the end of 1860. At this time he was selected by the Secretary of State for India as telegraph engineer to accompany Colonel, now General Sir Arnold B. Kemball, K.C.B., at that time British Resident at Baghdad, to examine and report upon the condition of the Turkish telegraph lines from Constantinople, through Asia Minor and Turkish Arabia, down to the Persian Gulf, with the view of establishing overland telegraph communication to India, after the failure of the Red Sea cable. In 1862 Mr. Greener returned to England, and reported personally to the India Office as to the condition of the above lines, and the possibility of their extension through Mesopotamia to the head of the Persian Gulf. In the same year he proceeded to Bombay, to accompany, as telegraph engineer, the expedition for taking soundings and selecting suitable stations as landing places for the proposed cable from Karachi to Fao. Mr. Greener constructed the land lines from Baghdad through Mesopotamia down to Fao, at the head of the Persian Gulf. The cable was laid successfully to Karachi, and communication between England and India completed in January, 1864. In 1865 Mr. Greener returned to England. Since that period he has been connected with the India Office as Inspecting Engineer for Telegraph Stores. Mr. Greener is also Inspecting Engineer for Telegraph Stores for the Crown Agents for the Colonies, and for the Agent-General for the Cape of Good Hope.

GREENHILL, John Hayton. Born in Belfast, 8th May, 1846; educated at the Collegiate School, and afterwards at the Royal Academical Institution. Obtained the degree of Bachelor of Music at Trinity College, Dublin, in 1869.

An ardent student in various branches of science, especially electricity, he became commercially interested in electric lighting in 1881 by his connection with Messrs. Crompton & Co., for whom he acted as Irish agent for many years. He commenced the manufacture of dynamos early in 1883, and has constructed a great many machines of various sizes, a modified type of Messrs. Mather and Platt's "Manchester" dynamo (for the construction of which he holds a licence from that firm) receiving his especial attention. He was elected President of the Belfast Natural History and Philosophical Society (one of the oldest scientific societies) in 1889, and re-elected for the sessions 1890-1891. He is a Member of the Institution of Electrical Engineers.

GÜLCHER, R. J. Born June 8, 1850, at Biala, near Bielitz, in Austrian Silesia; educated partly at the Protestant School of his native town and at the "Real-Gymnasium" (a Latin school), at Görlitz, after which he attended the Polytechnic School at Zürich, and the Polytechnic Institute "Joanneum" at Graz. He showed remarkable aptitude for technical engineering and mathematics at an early age.

In 1872 Mr. Gülcher undertook the management of a small mechanical repairing workshop in his father's cloth manufactory, and such was his energy that in 1875 he found himself in possession of a large ironfoundry and machine-factory. In 1878 he bought of Messrs. Siemens and Halske three electric arc lamps, together with as many dynamos, for the lighting of his foundry; each dynamo supplying the current for one lamp only, as at that time the "division of the electric light" as to arc lamps was unknown. After some few days, however, the von Hefner-Alteneck regulators refused to act, owing to the dust in the foundry works, and it was this circumstance that led him to the invention of a new and improved arc lamp, without clockwork. Experimenting upon these new lamps, he found that two and more of them would work satisfactorily, when connected in multiple or parallel arc, from *one* dynamo. This astonishing result, hitherto deemed impossible, led Mr. Gülcher to the invention of his improved dynamo, and, finally, to that of his system of dividing the electric light, based on the parallel arc, and known as "the Gülcher low-tension system," which enabled him to run any number of arc and incandescent lamps of various candle-power from one single dynamo. In 1881 Mr. Gülcher exhibited his new system at the Paris Exhibition, where he was awarded a gold metal, and, since then, the Gülcher system has been acknowledged more and more as the only one by which an actual and perfect division of the electric light is attained. In 1882 his patents for Great Britain were acquired by the Gülcher Electric Light and Power Com-

Digitized by Google

pany, and a year later the company "Helios," at Ehrenfeld-Cologne, purchased his German patents. His Austrian and other patents are executed by his own factory in Biala. Since 1885 Mr. Gülcher, in connection with the firm of Julius Pintsch, in Berlin, has been studying and experimenting upon the principle of the "Direct Transmutation of Heat into Electricity." As the first result of these studies, in 1887, he obtained patents for the invention of a new and improved thermo-electric battery of a remarkable efficiency and durability, and lately has made further improvements in that direction.

HASKINS, Caryl Davis. Born at Waltham, Mass., 1867, and educated in public schools in the United States and at Allison Towers and Rosindale Schools, England, London University, &c.

Mr. Haskins's early study was directed chiefly towards the "Natural Sciences," more especially Zoology and Biology. He took first and second-class honours at South Kensington in various scientific subjects. In 1885 he joined Prof. Henry Ward, of Rochester, N.Y., as assistant in Zoology; but, returning to England, he took up the study of engineering, entering the service of his father's firm, Haskins, Davis and Co., of London. In 1887, having already taken up the study of electrical engineering, Mr. Haskins entered the employ of Messrs. S. Z. de Ferranti and Co., of London, as an assistant to Mr. Ferranti. While there he became more especially identified with early work on transformers and recording meters, finally taking charge of the manufacture of the Ferranti meter at the Charterhouse-square works. During his connection with Mr. Ferranti, Mr. Haskins was so fortunate as to assist at many of the early 10,000-volt experiments. Returning to America in 1888, Mr. Haskins first engaged in business in New York, and in 1889 he entered the service of the Thomson Electric Welding Company, of Lynn, Massachusetts, as constructing draughtsman and electrician. His experience with recording meters, however, led within a brief time to his forming a connection with the Thomson-Houston Electric Company, also of Lynn, with whom he undertook testing and certain experimental work in connection with the Thomson Recording Wattmeter, then just developed. The subject growing in importance, Mr. Haskins, in 1890, took charge of the Company's meter business, which in 1891 had grown to such considerable proportions that it was created a department, and he became the manager. On the consolidation of the Thomson-Houston and Edison Companies, under the general title of the General Electric Company, Mr. Haskins took the management of the united meter interests of the two concerns, to which, early in 1893, all the indicator and instrument business was added. Mr. Haskins is the inventor and patentee of several useful electrical devices. He is a member of the American Institute of Electrical Engineers, the New York Electrical Society, &c. Mr. Haskins has read numerous Papers before scientific societies, and has also lectured on electrical subjects. In 1892 his first book was published, entitled "Transformers"; and he is the co-author of "Questions and Answers about Electricity." He has also written numerous Papers which have appeared in various technical and other journals from time to time.

HAYNES, Frederick Troake Jago, M.I.E.E. of England and of America, Divisional Engineering Superintendent of Telegraphs, Great Western Railway, Taunton. Born at Exeter on 9th April, 1844; was educated at Hele's School in that city.

Mr. Haynes entered the service of the Bristol and Exeter Railway Company in the telegraph superintendent's office at an early age. In 1865 the Bristol and Exeter Railway Company decided to adopt the block telegraph system. Mr. Haynes was from then, until the end of 1869, engaged in inspecting and reporting upon all matters affecting the safe working of the line. In January, 1870, Mr. Haynes succeeded the telegraph superintendent. Mr. Haynes has devoted much time and attention to the economical and efficient maintenance of land lines, and has written some interesting papers on that subject. He has also effected improvements in various railway electrical appliances. On June 1, 1888, the telegraphs on the Great Western Railway, from Swindon throughout the West of England and South Wales, were placed under his supervision.

HEDGES, Killingworth, M.I.C.E., M.I.E.E. Born at Streatham, Surrey.

Mr. Hedges was educated at Brighton until the age of sixteen, when he was articled to Mr. James Easton, C.E., for five years, during which period he served his time in the shops of the firm of Easton and Amos. He afterwards superintended the erection of the large pumping machinery on the North Holland Sea Canal, and took a post as engineer on the construction of the Denver and Rio Grande Railway, Colorado, obtaining two Miller prizes at the Institute of Civil Engineers for Papers describing these works. His first connection with electricity was in 1873, when he was sent to Paris to report on the then recently-invented Jablochkoff candle. In 1879, he was employed to report to the Mersey Dockyard as to the suitability of the electric light for the Liverpool docks, and afterwards carried out the present installation. He superintended the electric lighting of the ss. "Chimborazo," in 1880, with the André lamp, the first steamer in which the incandescent light was adopted. He exhibited switches and arc lamps at the Paris Electrical Exhibition, and obtained a bronze medal; also at the Crystal Palace, where a silver medal was awarded him. He invented the fusible cut-out of metallic foil, which was perfected and used throughout the Vienna Electrical Exhibition, and for which a special certificate from the Scientific Commission was granted. He published a pamphlet entitled "Useful Information on Practical Electrical Lighting," in 1879; and a book with the same title in 1881. He is the author of "The Supply of Electricity by Local Authorities," also "Pre-

Digitized by Google

cautions on Introducing the Electric Light;" of a Paper entitled the "Fire Risks of Electric Lighting," read before the Royal Institute of British Architects in 1884; and was awarded a Telford Premium by the Institution of Civil Engineers for his Paper on "Central Station Lighting," published in Vol. LXXXVIII. of the *Minutes*, 1887. This was published in book-form, revised up to date, January, 1887. He has also written several miscellaneous Papers on scientific subjects. Mr. Hedges has devoted his attention more especially to the improvement of electrical fittings and to the manufacture of carbons. He is also author of a Paper entitled "Precautions on Taking Supply of Electricity by Means of Transformers," read at Newcastle Meeting, British Association, 1889, in which the necessity was shown of protecting the secondary circuit by means of some safety device to earth the circuit in event of the insulation of the transformer giving way. In 1891, after visiting the Electrical Exhibition at Frankfort, he obtained permission from the various German municipalities and firms, who there described the systems of lighting the principal towns, to reproduce their reports and plans in a book, entitled "Continental Electric Light Central Stations." He has recently given his attention to the question of doing away with oil in bearings, and has invented a special form of carbon material, termed "carboid," which can be used for the axle bearings of tramcars and for shafting, allowing of the bearing to be heated to a considerable temperature without materially increasing the friction, which has been successfully adopted. The invention was shown at the *conversazione* of the Royal Society in 1891, and a descriptive Paper on "Materials for Bearings used without Lubricants" was read at the Edinburgh meeting of the British Association.

HEFNER-ALTENECK, Friedrich von.

Born in the year 1845, at Aschaffenburg, in the kingdom of Bavaria; is the son of Dr. J. H. von Hefner-Alteneck, the archæologist. In the year 1851 Herr von Hefner-Alteneck went with his parents to Munich, and even in his early youth he displayed a decided inclination for the study of natural science and great skill in the production of mechanical appliances with the simplest means. Later on he attended the Polytechnic Schools at Munich and Zurich, and for about twelve months he devoted himself to practical work in mechanical optical establishments in Munich. A visit to the Paris Exhibition of 1867 gave him an opportunity, which he eagerly seized, to become directly acquainted with mechanical science before he entered into practical life. On the return journey, in Berlin, Herr von Hefner-Alteneck inquired of the late Dr. Werner Siemens whether the latter could hold out any prospect of his obtaining an appointment in the firm of Siemens and Halske. The reply was to this effect: "If you like to commence at the bottom as a workman in the shop you can enter at once." To this von Hefner-Alteneck consented. He did not long remain a simple workman, but was soon transferred from the workshop to the engineering department, of which he became director when a vacancy occurred. In this capacity Herr von Hefner-Alteneck originated many of the inventions which have emanated from the firm of Siemens and Halske, several of which are patented in his own name and in that of Siemens and Halske. Amongst these may be named various important improvements in telegraphic apparatus, including an apparatus with an ingenious feed motion for the continuous delivery of Morse characters, by means of a key-board, on which the separate letters are taken, irrespective of the different length of the same, as in a modern type-writer; the simplification of so-called electric alarms, and safety appliances for railways, &c. The best known inventions of Herr von Hefner-Alteneck refer to electric lighting, and he stands in the foremost rank among its originators, as far as the new era is concerned. When he commenced the study of electric lighting, in 1870, there already existed the Pacinotti-Gramme ring armature. In the year 1872 he invented the drum armature for the dynamo-electric machine, by which the disadvantages presented by the interior coils of the Gramme ring were avoided, and by employing a massive iron cylinder, instead of the ring, the number of the magnetic lines was increased. In 1877 he invented his well-known machine for alternating currents. Both machines, but especially the former, have served as types for a whole series of dynamos which comprises the Edison machine. In the year 1876 Herr von Hefner-Alteneck constructed first a so-called bar armature for his drum armature for low electric tension with a peculiar kind of conducting arrangement on the front faces, in two different planes, which solved the problem of the reciprocal crossing of many coils in the narrowest possible space. Although the Jablochkoff candles met with great success in 1877 when employed for street-lighting in Paris, Herr von Hefner-Alteneck was of opinion that this success could not last, notwithstanding the seductive simplicity of the candles, and that the future of electric lighting depended on the improvement of the old carbon light regulators. In this spirit he constructed his differential lamp, several of which could be worked in one circuit, with the mechanism applied above the lantern, which has since become typical for all arc lights. With this lamp, and the machine for alternating currents already referred to, the firm of Siemens and Halske established its first electric lighting installation with a divided-regulator light in the Kaiser Gallery in Berlin, 1879, and similar ones shortly after in the Berlin and Munich railway stations, which remain unchanged at the present time. The invention produced at the same time by the Gebrüder Siemens in Charlottenburg of the so-called wick carbons, which rendered the light of the arc lamp steadier than formerly, contributed considerably to the success of this system of lighting, and it increased so rapidly that at the Paris Electric Exhibition in 1881 the Jablochkoff electric candle was eclipsed by the numerous installations with the divided light, and by Edison's incandescent lamp

PROF. VON HELMHOLTZ.

Digitized by Google

also, which appeared among them. Herr von Hefner-Alteneck's more recent work has referred especially to the improvement of the various kinds of apparatus required for electric lighting in all its forms, to the improvement of measuring instruments of all kinds for practical use in the machine stations, &c. A dynamometer, invented by Herr von Hefner-Alteneck, which measures the force transmitted by a belt direct, is also widely known. Finally, it should be mentioned that Herr von Hefner-Alteneck proposed a new unit of light in 1883, consisting of a small and very simple lamp with a burner of an invariable size, in which a substance, having a perfectly definite chemical composition—"amyl-acetate"—is burned with an unvarying height of flame. This unit of light has given rise to many researches and treatises in Germany, where, in fact, it is now almost exclusively employed under the name of the Hefner Lamp, as a standard in measuring the intensity of light. Herr von Hefner-Alteneck, who retired from the firm of Siemens and Halske at the end of 1889, is occupying himself since his retirement chiefly in scientific research. His writings are to be partly found in the lectures and treatises which are printed in the *Electrotechnische Zeitschrift* and other papers, and also in the respective patents, &c.

HELMHOLTZ, His Excellency Hermann Ludwig Ferdinand von. Born August 31, 1821, at Potsdam.

In his seventeenth year Helmholtz entered the University of Berlin as a student, and wished to devote himself to the study of physics; but circumstances compelled him to enter on the study of medicine. In 1847, in a small pamphlet on "The Conservation of Energy," he showed that no energy is lost in the world, but that it alters only in its mode of manifestation. At the same time, he showed that all the processes of Nature obey the laws of mechanics. Previously to this, heat had always been regarded as a "substance." Helmholtz showed "that the phenomena of heat can all be looked upon as motion." His article was, however, rejected by *Poggendorff's Annalen*, and amongst the members of the Berlin Academy only Jacobi, the mathematician, espoused his cause. Even when his fame penetrated through wide circles, doubt was thrown on the originality of this epoch-making work. Helmholtz had written his pamphlet in ignorance of the work of Robert Mayer (1842 and 1845). In 1850 Helmholtz estimated the mean rate of transmission of nervous activity in the motor nerves of the frog, and found it to be 26·4 metres per second, or less than 10 times slower than the velocity of sound in air. In the course of these researches, he enriched physiological experimental methods by his myographion. In the year 1851 Helmholtz astounded the scientific world by his discovery and description of the ophthalmoscope, for examining the retina in the living eye. When Professor of Anatomy and Physiology in Bonn (1855), he investigated the mixture and visual action of the spectral colours. Ten laborious years he devoted chiefly to his "Text Book of Physiological Optics" (1856-1866). In this work he made it "his duty to test and verify all essential points by his own observations and experiments." The new Chair of Physiology in the University of Heidelberg was offered to Helmholtz, and accepted by him. It was in Heidelberg that he displayed a new aspect of his genius. He there produced his work entitled "The Doctrine of Tone Sensations as a Physiological Basis of the Theory of Music." In 1871 Helmholtz accepted the Chair of Physics in the University of Berlin. From this time forward he was engaged chiefly in inquiries in the great departments of electricity and hydrodynamics. In the autumn of 1887 the German Empire founded a physical-technical institution, Dr. Werner Siemens having given for the purpose a sum of £25,000. The institute comprises two departments, one for purely scientific purposes, and the other concerned with the application of scientific physics to technical purposes. The first is a laboratory for the advancement of pure science. Such work as may be necessary for the advancement either of science or of technical pursuits, and which requires for its accomplishment specially fitted rooms, costly apparatus, and unlimited time on the part of the worker, is to be done there. The second department has for its object the development of technical-scientific methods and appliances, and the keeping of industry abreast of the progress of science. Over this great and important new institution, Helmholtz was chosen by the Government to preside, whilst he was further appointed director of the first, or purely scientific, department. In consequence, he resigned the Chair of Physics and the directorship of the Physical Institute of Berlin, though he still retains the position of Professor ordinarius in the University, and delivers lectures on special subjects of theoretical physics. In 1883 the German Emperor conferred on Herr Helmholtz and on his family the honour of hereditary nobility. In 1892 Prof. Helmholtz attended the meeting of the British Association in Edinburgh, and lent the support of his valuable name to a scheme for the internationalisation of the fundamental electrical units. He visited Chicago during the recent International Electrical Congress.

HERING, Carl, B.Sc., M.E., was born 1860 in Philadelphia, U.S.A., and is the son of Dr. Constantine Hering, of Philadelphia, the well-known founder of homœopathy in America. He received his collegiate education in the University of Pennsylvania at Philadelphia, taking the course in Mechanical Engineering. He graduated in 1880, taking the degrees of Bachelor of Sciences and Mechanical Engineer.

In 1881 Mr. Hering was elected Instructor in Mathematics and Assistant in Mechanical Engineering in the University of Pennsylvania, which position he relinquished to become Assistant in Physics in the same University under Prof. Barker, at that time one of the principal consulting electricians of the Edison Company. In 1883 Mr. Hering was elected Commissioner of the Franklin Institute of Pennsylvania to the

Digitized by Google

International Electrical Exhibition at Vienna, at which exhibition he was made an active member of the International Jury who undertook the scientific tests of the exhibits. He then continued his studies at the Polytechnikum in Darmstadt, Germany, under Prof. Kittler, which was at that time one of the very few colleges where electrical engineering was taught as a special course, and shortly after beginning his studies Prof. Kittler appointed him his assistant. In 1884 he became acting-electrician for the Philadelphia International Electrical Exhibition and Member of the Scientific Commission appointed to make the tests and reports. In the latter capacity he urged the importance of a comparative life-test of incandescent lamps, which, though at first opposed and ridiculed by many members of the Commission, was finally started and was afterwards carried out by Prof. Marks for the Franklin Institute. These tests, now well known as the Franklin Institute tests, remain the only ones of the kind made at an exhibition. In 1885 he was electrical engineer first for one of the large manufacturers in Germany and then for a company in Philadelphia, after which he commenced his present occupation as consulting electrical engineer in the latter city. In 1889 Mr. Hering was sent to Paris by the United States Government to report on the electrical exhibits at the Paris International Exposition, which Report has just been published. While there he was appointed a member of the Jury in Class 62 (Electricity), representing the United States. He was also elected delegate from the Franklin Institute to this exhibition for the class "Electricity," and was representative of the American Institute of Electrical Engineers at the International Electrical Congress in Paris. At the close of the Exhibition he received the decoration known as the "Gold Palms" from the French Government. In 1891 he was Chairman of the Delegation of the American Institute of Electrical Engineers to the International Congress of Electricians at the Frankfort Electrical Exhibition; at this Exhibition he was also a member of the Scientific Commission (Jury), and a delegate from the Franklin Institute. For about a year he was one of the editors of the *Electrical World*. Mr. Hering is the author of several Papers on electrical subjects and of several books on electrical subjects. He is the inventor of several improvements in dynamos and storage batteries.

HERTZ, Dr. Heinrich, was born in 1857, at Hamburg, and is the son of Senator Dr. Hertz. He studied engineering till 1878, and then devoted himself to physics under Helmholtz and Kirchhoff, at Berlin, where he took the degree of Doctor of Philosophy in 1880. He was assistant to Helmholtz till 1883, when he became "privat docent" in the University of Kiel. In 1885 he was made Professor of Physics in the Technical College at Karlsruhe, and in 1889 succeeded the late Dr. Clausius in the Chair of Physics at Bonn. In 1889 he was elected an honorary member of the Manchester Philosophical Society, and is also a corresponding member of the Royal Academy at Berlin. Most of his experimental work deals with electricity. Towards the end of 1886 he detected a special action of ultra-violet light upon the electric discharge. In the following year he obtained evidence that electric induction was propagated through air with a finite velocity. In the course of 1888 he succeeded in producing electrical waves and rays in air, which had been predicted long ago by Maxwell, and which was studied theoretically by Fitzgerald, Heaviside, Lodge, and others. Dr. Hertz's researches were translated by Mr. G. W. de Tunzelmann, and published in *The Electrician*; and Messrs. Macmillan and Co. have recently published a translation by Mr. D. E. Jones.

HOHO, Paul. Born at Wittem (Holland), September 29, 1863.

Having completed his professional studies in Holland, M. Paul Hoho in 1881 began an engineering course at Louvain University, where he obtained in 1885 and 1886 respectively the diplomas of Civil and Mechanical Engineering and of Mining and Industrial Engineering. A few days after leaving Louvain M. Hoho became engineer to the Société Industrielle d'Electricité at Brussels. In 1887 he joined the Société l'Electrique, where he soon became chief engineer. In 1889, he changed this position for that of consulting engineer to the Société, which he still occupies. While at the University he invented a system of transmitting drawings, &c., by telegraph, to which, however, he himself did not attach much importance. In 1889 he brought out his "Composite Field" dynamo, which is able to yield two different currents at one and the same time from a single armature. M. Hoho successfully designed and constructed, at his own risk, a 21-kilowatt machine of this type, without any preliminary experimenting. He has also brought out a dynamo with "composite magnetic excitation," in which the speed may be varied through wide limits without altering the volts. M. Hoho was one of the earliest of practical pioneers and designers of continuous-current transformers. In 1890 M. Hoho and Prof. Lagrange, of the École Militaire (Brussels), discovered a peculiar luminous and calorific phenomenon, which occurs under certain circumstances in liquids when traversed by an electric current. Minute investigation leads the discoverers to anticipate a possible practical utilisation of the phenomenon. A Paper laid before the Académie Royale des Sciences in August, 1891, describes the first portion of their researches and their explication of the phenomenon. M. Hoho is a member of the Société Internationale d'Electricité, of the Institution of Electrical Engineers (London), and is on the Council of the Société Belge d'Electriciens.

HOLMES, Arthur Bromley. Born at Derby, June 8, 1849; educated at Repton School, near Burton-on-Trent.

Mr. Holmes, after leaving school in 1868, served a pupilage of five years under Mr. A. Buchanan, M.Inst.C.E., at the Britannia Ironworks, Derby, and was subsequently for seven years in the employment of Messrs. Handyside

JOHN HOPKINSON.

Digitized by Google

and Co. at that address, engaged in superintending the construction and erection of the various large engineering works undertaken by that firm. In 1881 Mr. Holmes commenced business on his own account in Liverpool as a consulting engineer in partnership with Mr. J. C. Vaudrey. He devoted his attention specially to electric lighting, and has been managing engineer of the Liverpool Electric Supply Company (Limited) since its formation in the year 1883. The central supply station of the Liverpool Company was one of the earliest established in this country, and has been in successful operation ever since. The company also carried out the entire electric lighting, including the provision of steam power, of the Liverpool International Exhibitions of 1886 and 1887. Mr. Holmes was elected a member of the Institution of Civil Engineers in 1888, and is a member of the Institution of Electrical Engineers. He is consulting engineer to the Birmingham Electric Supply Company. Mr. Holmes is the author of two useful books on electric lighting—viz., "The Electric Light Popularly Explained," and "Practical Electric Lighting," both of which have had a large sale, and reached the fifth edition.

HOPKINSON, Edward, M.A., D.Sc., M.Inst.C.E. Born in May, 1859; son of Alderman Hopkinson, M.Inst.C.E., of Manchester. He was educated at Owens College, Manchester, and obtained an exhibition in mathematics at Emmanuel College, Cambridge, in 1877, and subsequently a Foundation Scholarship. He graduated as 10th Wrangler in the Mathematical Tripos of 1881, and was elected to a Fellowship at Emmanuel College in 1883. In 1831 he took the degree of D.Sc. in the University of London in the branch of electricity and magnetism treated mathematically.

In 1882 Dr. Hopkinson became assistant to the late Sir William Siemens, and continued with him until his death. During this time he carried out the experiments at Portrush in connection with the first electrical tramway in the United Kingdom. He received a silver medal from the Society of Arts for a Paper on the Portrush Tramway, read before the Society. After the death of Sir William Siemens Dr. Hopkinson designed and carried out, in 1885, the Bessbrook and Newry Electrical Tramway, which is worked entirely by water power, and still continues to be the only electrical tramway on which both goods and passengers are carried on a large scale. He read a Paper before the Institution of Civil Engineers on the construction and working of this tramway, which was awarded a gold medal and Telford premium. In 1887 he became a partner in the firm of Messrs. Mather and Platt, of Salford, and undertook the charge of the Electrical Engineering Department, of which he continues head. When the firm was transformed into Mather and Platt, Limited, he became one of the managing directors. He is the inventor, in conjunction with Dr. John Hopkinson, of the "Manchester" dynamo, and of various improvements in connection with dynamo machines and the applications of electricity. He is the joint author with Dr. John Hopkinson of a Paper on Dynamo Electric Machinery, printed in the *Transactions* of the Royal Society. He designed the electrical plant for the City and South London Electric Railway, and the electrical part of the work was carried out under his direction. This undertaking was described by him in a Paper read before the Institution of Civil Engineers in 1893, for which he again received a Telford premium and Stephenson medal. Dr. Hopkinson is a member of the Institution of Electrical Engineers.

HOPKINSON, John, D.Sc., F.R.S. Born at Manchester in the year 1849.

Dr. Hopkinson is the eldest son of Mr. Alderman Hopkinson, of Manchester. His mother is a daughter of the late John Dewhurst, of Skipton. Till the age of fifteen and a-half he was educated at Lindow Grove School and Queenwood College, both schools having for their principal Mr. Charles Willmore. He then went to Owens College, remaining there two years and a-half. From Owens College he went to Trinity College, Cambridge. At the beginning of 1871 he graduated as Senior Wrangler, and afterwards obtained the first Smith's prize. Whilst an undergraduate at Cambridge, he graduated as Doctor of Science at London University. Early in 1872 he joined Messrs. Chance Brothers and Company's Lighthouse Works, near Birmingham, as engineer, and resided in Birmingham nearly six years. Into lighthouse work he has introduced many improvements, notably the Group Flashing Apparatus; probably Dr. Hopkinson has designed a greater number of special forms of lighthouse apparatus than anyone else, and with uniform success. His connection with the firm still continues. In 1878 he moved to London and began general practice as an engineer. He speedily became known as an expert in patent cases; an important part of his practice still lies in this line. A good deal of Dr. Hopkinson's leisure time has been devoted to scientific research. He has published several important Papers on "The Specific Inductive Capacity of Bodies;" but is perhaps best known for his researches on dynamo machines and subjects allied thereto. His attention was first directed to this subject in 1879, when he made a series of experiments on a Siemens machine, and first introduced the methods of the characteristic curve. Early in 1883 he made improvements on the Edison dynamo machine, which may be said to be the parent of the great improvement which the last six years has seen in dynamo machines of all sorts. In 1883 also he was appointed to lecture at the Institution of Civil Engineers. On this occasion he developed certain points in the theory of alternate currents which were subsequently carried further in a Paper read before the Society of Telegraph Engineers. During the next three years he worked out the theory of the dynamo machine on a thoroughly satisfactory basis, made elaborate experiments on the magnetic

Digitized by Google

properties of iron and steel, and then, in conjunction with his brother, Dr. E. Hopkinson, published a Paper in which the results of experiments on a dynamo machine were first fully and quantitatively accounted for. Dr. Hopkinson was elected a Fellow of the Royal Society in 1878. He is a member of the Senate of the London University, is a member of the Council of the Institute of Mechanical Engineers, and was President of the Institution of Electrical Engineers for 1890. In this year also one of the Royal Medals was awarded him by the Royal Society.

HOUGHTON, Edward John, M.I.E.E.
Born in Kent in the year 1844; educated at Milton College, the Birkbeck Institution in London, &c.

Mr. Houghton entered the telegraph service of the London, Brighton, and South Coast Railway Company in his fourteenth year. The late Mr. E. G. Bartholomew, F.R.S., was then the telegraph engineer to the railway, and from him the subject of our notice received his earliest instruction in electricity. Mr. Bartholomew left the Brighton Railway, and was succeeded by Mr. Edward Cripps, to whom, in 1869, Mr. Houghton became assistant. He acquitted himself in this position so satisfactorily that upon the death of Mr. Cripps, in 1875 he was appointed electrical engineer to the company, which position he still retains. Mr. Houghton has done some good work, and has patented an electrical "tunnel alarm," "single-needle sounder," a "system of working single needle-speaking instruments without batteries at intermediate stations," a new "block signalling system," and, in conjunction with the locomotive engineer to the railway, has invented a system of electric lighting for trains. Mr. Houghton has had much experience in electric lighting generally, the fitting up of ships, trains, &c., with the incandescent system, and buildings with arc lights. He has been continuously working with electric accumulators since their introduction into this country by Messrs. Faure and Philippart and Major Ricarde-Seaver. It is largely owing to his perseverance that the electric lighting of trains is coming into vogue.

HOUSTON, Prof. Edwin J. Born at Alexandria, Virginia, U.S.A., July 9, 1844.

Prof. Houston is one of the inventors of the Thomson-Houston electric lighting system, now in extensive use, and has taken out numerous patents for electrical inventions, both conjointly with Prof. Elihu Thomson and individually. He acts as an expert in electrical patent cases in the United States law courts. In 1884 he was appointed a member of the United States Electrical Commission, and the Franklin Institute of the State of Pennsylvania chose him as chief electrician of its International Electric Exhibition, and was elected to preside over Section C of the Chicago Electrical Congress in 1893. He is Professor of Natural Philosophy and Physical Geography in the Central High School of Philadelphia, and Professor of Physics in the Franklin Institute of the State of Pennsylvania, and President of the American Institute of Electrical Engineers. Prof. Houston is the author of "Elements of Physical Geography," "Elements of Natural Philosophy," "Easy Lessons in Natural Philosophy," "Elements of Chemistry," "A Short Course in Chemistry," "The Telephone," "A Dictionary of Electrical Words, Terms and Phrases," "Primers of Electricity," "The Electric Transmission of Intelligence," "Electric Measurements," and "Electricity and Magnetism." He is one of the editors of the *Journal* of the Franklin Institute, and is a frequent contributor to scientific periodic literature, especially in the domain of theoretical and applied electricity.

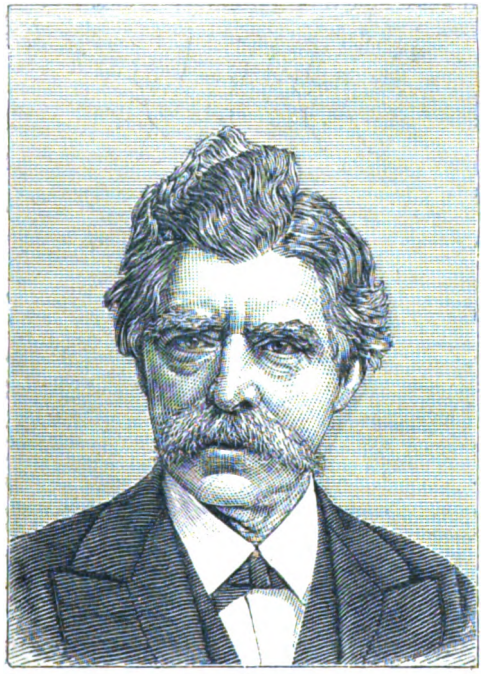
HOWELL, J. C., was born at Llanelly in the year 1859, and was educated at home and at the Independent College, Taunton.

He was trained as an engineer in his father's business, and in the early part of 1882 turned his attention to the electric light, and shortly afterwards became sole agent for South Wales for Messrs. Crompton and Co. Several important installations were erected by him in collieries and tinplate works during that and the following years. During this period Mr. Howell began the study of storage batteries, and being convinced that for electric distribution on anything like a large scale storage batteries having a high capacity discharge rate were absolutely necessary, he worked out and patented a system of producing porous lead plates of very extended surface which could be formed on the old Planté method. In 1886 the demand for accumulators had grown to such an extent that it was found necessary to form a company to exploit the manufacture, Mr. Crompton taking a prominent part in the formation of the new company, the works in South Wales being under the immediate management of Mr. Howell himself. Large batteries under Mr. Howell's patents have been supplied to the leading electrical supply companies of London who work under the low-tension system, notably the Kensington and Knightsbridge Electric Lighting Company and the Westminster Electric Supply Corporation.

HUGHES, David Edward, F.R.S., &c.
Born in London, May 16, 1831.

During the year 1838 Mr. Hughes's parents emigrated to the United States, where, in the year 1850, he attracted so much attention by his musical talents that Herr Hast, an eminent German pianist in America, procured for him the professorship of music in the College of Bardstown, Kentucky. Mr. Hughes entered upon his academical career at Bardstown in the above-mentioned year, and at the age of nineteen he appears to have displayed an equal aptitude for physical science and mechanics, for upon the Chair of Natural Philosophy becoming vacant, the college authorities, knowing his proficiency in the subject, offered it to him. It was here that Prof. Hughes commenced the development of his design of the printing telegraph which bears his name. In 1853 he removed to Bowlingreen, in Warren Co., Kentucky, and

Digitized by Google



DAVID EDWARD HUGHES.

Digitized by Google

Digitized by Google

acquired more freedom by taking pupils. The main principle of his type-printer was the printing of each letter by a single current, the Morse instrument, the only rival then in the field in America, requiring an average of three currents for each signal. In 1854 Prof. Hughes went to Louisville to superintend the making of his first instrument, but the patent for it was not taken out in the United States until 1855. In that year the invention may be said to have become a practical success, and no sooner was this the case than Prof. Hughes received a telegram from the editors of the *American Associated Press*, summoning him to New York. The American Telegraph Company was then in possession of the Morse instrument, and levied rates for transmission which were felt to be excessive. The Hughes type-printer was therefore taken up in opposition to the Morse, a company was formed, and the lines of several small companies—among which was the Western Union—were leased. In 1857 these smaller companies united to form one large corporation—the present Western Union Telegraph Company. In that year Prof. Hughes, leaving his instrument in the hands of the Western Union, came to England in order to effect its introduction here. He endeavoured to induce the then Electric Telegraph Company to adopt it, but with such ill-success that in the year 1860 Mr. Hughes went over to France, where he met with a much more encouraging reception. The French Government agreed to give the instrument a year of practical work on the French lines, and if found satisfactory it was to be finally adopted. It proved a thorough and complete success, and Prof. Hughes was constituted by Napoleon III. a Chevalier of the Legion of Honour. In 1862 Prof. Hughes went to Italy, where a commission was appointed, and a period of probation—six months—had to expire before the instrument was taken over. From Italy he received the Order of St. Maurice and St. Lazare. In 1863 the United Kingdom Telegraph Company introduced the type-printer in their system. In 1865 Prof. Hughes proceeded to Russia, and in that country his invention was adopted, after six months' trial, on the St. Petersburg-Moscow circuit. He was there created a Commander of the Order of St. Anne. Two years later he also went to Berlin, and introduced his apparatus on the Prussian lines. 1867 found him on a similar mission in Austria, where he received the Order of the Iron Crown; and in Turkey, where the then Sultan bestowed upon him the Grand Cross of the Medjidie. In the same year he was awarded at the Paris Exhibition one of the ten gold medals designed to mark the very highest achievements in science. In 1868 he introduced his apparatus into Bavaria and Wurtemburg, where he obtained the Noble Order of St. Michael. The following year witnessed its adoption in Switzerland and Belgium, and in 1875, upon visiting Spain, Prof. Hughes was made a Commander of the Royal and Distinguished Order of Carlos III. We have also to thank the eminent subject of our memoir for the microphone and the beautiful and ingenious apparatus known to science as the induction balance. Prof. Hughes represented Great Britain as one of the Commissioners at the Paris Electrical Exhibition, 1881, he was also elected president of one of the sections of the International Congress of Electricians, and made Commander of the Legion of Honour. He was elected Fellow of the Royal Society soon after his discovery of the microphone, and was President of the Society of Telegraph-Engineers and Electricians in 1886. The last few years he has made special researches upon the cause of magnetism, and has given several important Papers upon this subject to the Royal Society. The Royal Society, with the assent of the Queen, awarded in November, 1885, the Royal Medal to Prof. Hughes for his electrical and magnetic researches, and for his invention of the microphone and induction balance. In 1889 he was elected Manager of the Royal Institution of Great Britain, and in 1891 made Vice-President of the same Institution.

JABLOCHKOFF, Paul. Born at Serdobsk (Government of Saratow) on the 14th of September, 1847.

M. Jablochkoff belongs to a distinguished and well-to-do family. His father was a municipal councillor and a member of the General Council of his province. His younger brother was, at the age of twenty-eight, a lieutenant-colonel in the Engineers, and took part in Skobeleff's expedition into Central Asia. M. Jablochkoff studied at the Military Engineering College at St. Petersburg, which he left in 1866. As he manifested scientific tastes he was then sent to the Military Galvano-Technical School. His military service lasted five years, and in 1871, his particular aptitude for electricity having been noticed by his superiors, he was appointed director-general of the Moscow-Koursk telegraph lines. It was while he occupied this post and had the telegraph workshops at his disposal, that M. Jablochkoff began to take a deep interest in the subject of electric lighting. In the year 1872, the Nihilist propaganda first began to inspire terror, and when the Emperor travelled by rail it was decided to light up the track in front of the engine by means of an arc light. M. Jablochkoff was responsible for the lighting on the Moscow-Koursk section, and the frequent failures of the apparatus then employed induced him no doubt to consider all possible means of improvement. In 1875 he quitted the Imperial Telegraph Service, and has since then devoted his time exclusively to scientific pursuits. Passing through Paris on his way to the Philadelphia Exhibition of 1876, M. Jablochkoff was so pleased with what he saw of that city that he never got any further on the road to Philadelphia. At this time there was being held in London an Exhibition of Scientific Apparatus, and M. Bréguet sent M. Jablochkoff to London to represent that well-known firm. On his return to Paris, the Bréguet workshops were placed at M. Jablochkoff's disposal. Eight months of experimental work resulted in the famous "Jablochkoff candle." This discovery gave an immense impetus to electric lighting. A company was

Digitized by Google

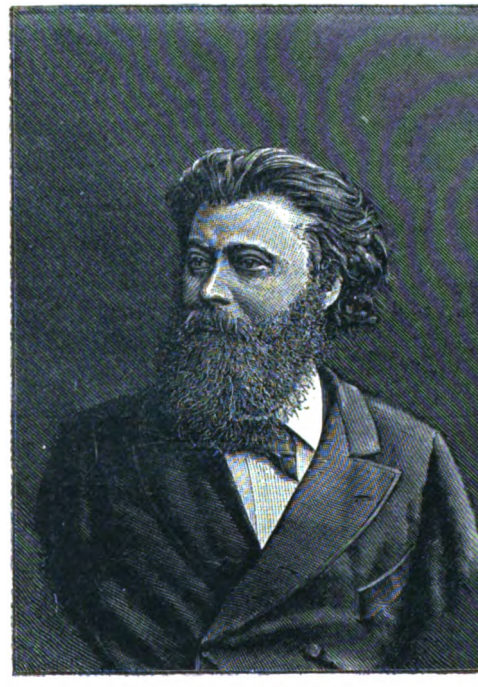
formed to work the patent, and in May, 1878, a magnificent row of Jablochkoff candles lit up the Avenue de l'Opéra at Paris. The Jablochkoff system of lighting soon spread, and before long "electric candles" were burning at Rome, and on the Thames embankment in London. The "electric candle," however, is by no means M. Jablochkoff's only claim to fame, as the following list of patents taken out by him will show:—(1) The Electric Candle; (2) The Distribution of Currents by means of Induction Coils; (3) An Incandescent Kaolin Lamp; (4) The Distribution and Division of the Electric Current by means of Condensers; (5) A Voltaic Battery consuming Coal; (6) An Alternate-Current Dynamo; (7) A Sodium Battery; (8) Auto-accumulators. Patent No. 2, as is well known, has been held to be the master patent for transformer distribution, and the system patented in No. 4 was at work at the Paris Exhibition in 1878.

JACKSON, Col. R. Raynsford. Born in 1823. At the age of seventeen Col. Jackson entered the cotton mills, at Blackburn, established by the late Sir William Feilden, Bart., a family connection of Colonel Jackson's, and was eventually taken into partnership, the proprietorship subsequently devolving upon him by the death of Sir William and the retirement of Colonel Feilden. Early in 1881 Colonel Jackson turned his attention to the telephone, and became the chairman of the National Telephone Company upon its formation. Upon the amalgamation of his company with the United Telephone Company and the Lancashire and Cheshire Telephone Exchange Company, he became a vice-president of the new National Telephone Company, of which he is still a Director.

JAMIESON, Prof. Andrew, M. Inst. C.E., F.R.S.E., &c. Born at the Manse, Grange, Banffshire, September 18, 1849; educated at The Gymnasium, Old Aberdeen, and Aberdeen University.

He served a complete apprenticeship to engineering, 1864-70, with Messrs. Hall, Russell and Co., Aberdeen Ironworks, under Mr. Thomas Russell; gained a Whitworth Exhibition; for some time draughtsman with the Great North of Scotland Railway; appointed, in 1873, as an assistant to Sir William Thomson and Prof. Fleeming Jenkin, in connection with the manufacture of the Western and Brazilian and Platino-Brazilian Companies' cables; accompanied the cable expedition in the end of 1874 to South America, and remained there as chief assistant electrical engineer to the telegraph companies until July, 1876. On his return to this country he was sent out by the Eastern Telegraph Company to the Mediterranean as electrician, his first duty being that of attending to the Muirhead duplex system of the Marseilles-Malta cable. From the beginning of 1877 until July, 1880, Mr. Jamieson took a leading part in most of the Eastern Telegraph Company's cable expeditions, visiting all the more important stations between England and India, the East Coast of Africa, and the Grecian Archipelago, localising faults, effecting repairs in as well as laying new submarine and subterranean lines, instituting and adjusting duplex working, and lecturing on submarine telegraphy to the different staffs at Porthcurnow, Malta, Alexandria, and Aden. During the exciting times of the Russo-Turkish War Mr. Jamieson had charge, as electrician, of the expedition carried out by the ss. "John Pender" and ss. "Great Northern," of connecting the British fleet lying off Princess Islands, Lampsaki, and Besiki Bay, by cable with the main system of the Eastern Telegraph Company, thus enabling orders to be sent direct by wire from the Admiralty in London to the commanding naval officers in the East. In July, 1880, Mr. Jamieson was appointed Principal of the Glasgow College of Science and Arts, in 1887 Professor of Engineering in the Glasgow and West of Scotland Technical College, and in 1893 he agreed to confine his lectures and laboratory work to Electrical Engineering, since both the number of his students and the range of the subjects taught had increased so much. Many of his students have been very successful in the Whitworth and National Scholarship competitions, and at the B.Sc. examinations at Glasgow University. He has written several Papers for different societies upon the subjects of "Lightning Protectors for Submarine Cables," "Cable Laying, Repairing, and Working," "The Action of Selenium in the Bell Telephone," "The Technical Education of Engineers, Shipbuilders, and Artisans," "The Fall of Resistance and Ratio of Candle-power to Electrical power spent in the Incandescent Lamp," "Electric Lighting in Steamships" (for which Paper he received a Telford premium from the Institution of Civil Engineers), "Electrical Symbols, Nomenclature and Notation," "Designing of Continuous Current Dynamo Machines" (for which Paper he received the James Watt Medal from the Institution of Engineers and Shipbuilders in Scotland), "The Insulation Resistance of Electric Light Installations," "Fire Risks due to Defective Installations of Electric Lighting and Defective Lightning Conductors," "The Electric Lighting of Public Buildings" (for which Paper he received a prize of books from the Institution of Engineers and Shipbuilders in Scotland), "Brown's New Rotary Expansive Engine," with results of brake horse-power tests, and of indicator diagrams, &c., on "Comparative Tests of Hellesen and E.C.C. Dry Battery Cells," and on the "London Electrical Engineering Laboratories," &c. (read at the Chicago International Congress of Electrical Engineers). He is author of the electrical engineering appendix to Prof. Rankine's "Rules and Tables," joint author of Munro and Jamieson's "Pocket Book of Electrical Rules and Tables," and author of two text-books "On Steam and Steam Engines," "On Magnetism and Electricity," and "On Applied Mechanics, for Electrical and Engineering Students." Prof. Jamieson has taken out several patents, including an automatically-acting self-relieving submarine cable grapnel, whereby rocks are cleared, but the cable hooked; a preventive against the action of the teredo-worm on submarine cable core; duplex

Digitized by Google



PAUL JABLOCHKOFF.

Digitized by Google

machinery for raising and laying submarine cables ; an electrical governor for steam engines ; a graded galvanometer, for avoiding the necessity of using shunts when taking insulation and other electrical tests ; a tubular marine boiler ; and a means of insulating the copper strip conductors of underground mains. A large number of steamers, houses, and buildings have been lighted by the electric light to his specifications and under his supervision. He designed the Thomas Russell Memorial Experimental Steam Engine for the Glasgow and West of Scotland Technical College.

JEHL, Francis. Born in New York in 1860, and was educated in the Grammar School No. 19. In the year 1875 he entered Cooper's Institution, in New York, where he studied Chemistry and Natural Philosophy.

Mr. Jehl was afterwards employed at the Western Union Telegraph Company's works, where Mr. Phelps was director. Here, however, he did not remain long, as he had an opportunity of going to Mr. Edison, at Menlo Park, New Jersey. On the establishment of Mr. Edison's machine works in New York, Mr. Jehl had charge of the testing department, and took part in the first installations. He afterwards paid visits to England, France, and Italy, for the purpose of constructing and making known the Edison electric light meter in those countries. The Société Electrique Edison were just then about to instal their works at Ivry-sur-Seine, and Mr. Jehl accepted a position with them, and helped in the starting of the works. In 1882 he was sent to Brünn to instal the new theatre. It may be mentioned that this was the first theatre that was completely lighted by electric light, and had not a single gas jet. He also installed the National Theatre and Palais Royal, in Bucharest, Roumania ; in fact, he carried on all the work for his company in Eastern Europe. He is joint inventor with Prof. Rüpp of the Faraday disc dynamo, electric meter, automatic regulator system of continuous transformers, &c.

JOHNSON, W. Claude, M.I.C.E., F.R.A.S., &c. (of the firm of Johnson and Phillips, Engineers and Electricians, Charlton).

At the age of seventeen Mr. Johnson became an articled pupil of Mr. W. F. Gooch, C.E., and after serving a five years' apprenticeship in the locomotive works of the Vulcan Foundry Company, in Lancashire, he joined the Applied Science Department at King's College, London. In 1869 he became assistant to Mr. H. Clifford, the engineer of the Telegraph Construction and Maintenance Company's works. It was here, in working out designs for improved cable machinery, under the immediate supervision of Mr. Clifford, that he obtained a clear insight into the most advanced form and construction of this important branch of engineering, and his keen observation had ample scope in the direction to which his abilities so conspicuously tend, viz., in the design and construction of machinery. He was subsequently engaged on the engineering staff of that company in laying the original cables, then called the British Indian, to Bombay, &c. In the following year he proceeded to the East Indies to assist in the laying of the first cables to Singapore, Java, &c. In 1872 he was appointed chief engineer in the expedition commanded by Captain Halpin, in laying the cables to Port Darwin, in Australia, and which connected the Eastern Extension Company's system with South Australia, *vid* the land lines which had just then been completed across that continent. In 1875 Mr. Johnson left the Telegraph Construction Company to join Mr. S. E. Phillips in establishing the now well-known firm of Johnson and Phillips. During the past seventeen years this business, which has its works at Charlton, in Kent, has grown to be one of the leading firms in electrical engineering, the works covering several acres of land, and generally employing between 300 and 400 workmen. On the death of Mr. Phillips in 1893 Mr. Johnson became the sole proprietor of the business.

JOYCE, Samuel, Jun., born in London, August 22, 1863, and educated at Barnet Grammar School.

In 1882 Mr. Joyce became an assistant in the Testing Department of Messrs. Paterson and Cooper. In 1884 he was appointed manager of their Instrument Department, which post he held till the summer of 1891. During this time he greatly improved the process of manufacture and calibration of the numerous instruments ; and also invented the dead-beat ammeters and voltmeters made by the firm ; among which, those ammeters for very large currents have been much used in electro-chemical work. When a student of the Institute of Civil Engineers Mr. Joyce obtained a Miller Prize for a Paper on Electrical Measuring Instruments. He is an Associate of the Institution of Electrical Engineers and a member of the Physical Society. In the summer of 1891 he left Messrs. Paterson and Cooper, and was appointed to the post of Assistant Lecturer and Demonstrator in the department of Physics and Electrical Engineering of the Municipal Technical School, Manchester.

KAPP, Gisbert. Born at Mauer, near Vienna, in September, 1852 ; entered the Polytechnic School in Zurich in 1869, where he was a pupil of Zeuner and Kohlrausch, and gained the diploma of mechanical engineer.

After working for some time in an engineering works in Germany, Mr. Kapp was appointed a member of the engineering staff at the International Exhibition in Vienna, in 1873 ; and in 1875 he came over to this country, where he obtained employment at the works of Messrs. Gwynne and Co. Having spent a few years in travelling on the Continent and in the North of Africa, Mr. Kapp came back to England in the beginning of 1882, and then met Mr. Crompton, who appointed him engineer to the Chelmsford works. In the spring of the same year these two gentlemen invented their system of compound winding for dynamos. About a year later Mr. Kapp invented a class of electrical measuring instruments now well known under the name of Current and Potential Indicators,

Digitized by Google

where permanency of calibration is obtained by the use of over-saturated electro-magnets. Mr. Kapp has, jointly with Mr. Crompton, taken out several patents, amongst which may be mentioned those for compound winding for dynamos; for instruments for measuring electric currents and electromotive force; for an electricity meter, and for improvements in dynamos. He also has taken out patents for making dynamos self-regulating without using two circuits on the field-magnet; for a self-regulating arc-light dynamo; for an alternate-current dynamo; for a high speed steam engine; for a system of alternate-current distribution ensuring constant pressure throughout an extended district; and for a transformer, the latter patent jointly with Messrs. Snell and Kent. In the spring of 1885 Mr. Kapp dissolved his connection with Messrs. R. E. Crompton, and brought out dynamos of his own, which are being manufactured under licences by Messrs. W. H. Allen and Co., of Lambeth, by Messrs Johnson and Phillips, of Charlton, by Messrs. Laurence, Scott and Co., of Norwich, and Mr. F. M. Newton, of Taunton. Since 1888 he has been practising as a consulting engineer on his own account. He was a frequent contributor to some German periodicals, to *The Electrician* and to *The Engineer*, and in May, 1886, he accepted an appointment as London editor of *Industries*, which he resigned in October, 1889. In 1885 he read a Paper before the Institution of Civil Engineers on "Modern Dynamos and their Engines," which received a Telford premium and medal; in June, 1886, his book on "Electric Transmission of Energy" was published in the "Specialist Series," and the fourth edition of this book is now going through the press. In November, 1886, he read a Paper before the Society of Telegraph-Engineers and Electricians on "The Predetermination of the Characteristic of a Dynamo," and in 1888 a Paper on Alternate-Current Transformers. In the beginning of 1889 he read a paper on "Alternate-Current Machinery," before the Institution of Civil Engineers, which was awarded a Telford premium and medal, and which was, by the permission of the Institution, republished in Van Nostrand's *Engineering Magazine*, New York. In the spring of 1891 he gave three Cantor Lectures on Electric Transmission of Power at the Society of Arts. He has also lectured at the School of Military Engineering on electric tramways and alternating currents In 1893 he published a book on "Dynamos, Alternators, and Transformers." Mr. Kapp is a Member of the Institution of Civil Engineers and a Member of the Council of the Institution of Electrical Engineers.

KELVIN, The Right Hon. Lord (Sir Wm. Thomson). Born at Belfast on June 25, 1824.

Though Irish by birth, Lord Kelvin's family is evidently of Scotch extraction, and belonged to that industrious race of Scotch-Irish farmers who live in peace and try to make the most of their holdings. In 1832 his father, Professor James Thomson, was appointed to the Mathematical Chair of Glasgow University, and earned a wide reputation both as a teacher and as an author of text-books on Mathematics and Arithmetic. His son William entered his class at Glasgow when he was eleven years of age, and was a great favourite with the students on account of his extraordinary quickness in solving the problems asked in the class. He was sent by his father to St. Peter's College, Cambridge, where he graduated as second wrangler and first Smith's prizeman in 1845. A wranglership can be taken by dint of study and facility in applying rules; but the Smith's prize is a kind of consolation stakes to genius. It is a test of originality and inborn mathematical power. While at Cambridge Thomson was no mere bookworm, but took an active part in field sports and athletics; he was a skilled oarsman, and won the Colquhoun silver sculls. He took an interest at that time in classics, general literature, and music, mainly through the influence and example of his father, who was a most cultured and well-informed man, and from whom he received the most, if not all, of his earliest instructions. But electricity and mathematical physics laid their hold and spell upon him, and soon absorbed all the teeming energies of his brain. He began to publish original investigations in mathematics at the age of seventeen, an age when most boys only thirst to learn, and do not dream of giving forth new truths. At twenty-two he was appointed Professor of Natural Philosophy in Glasgow University, an act which shows the confidence in his future which he had already inspired. One of the Tutors of St. Peter's College wrote at this time:—"He is regarded here by the most competent judges as the first man of science, of the rising generation, in this country." Lord Kelvin has repaid this confidence by continuing to associate himself with Glasgow in spite of many temptations to remove to Cambridge and elsewhere. In Glasgow he is a great figure, and its citizens are justly proud of him. We need not narrate all the incidents of his career, nor tell the titles of all his important Papers on science. It must be remembered that his mind has been extraordinarily prolific of investigations in all branches of physics, but especially in the domains of heat, electricity, and dynamics. His great work on Natural Philosophy—undertaken with Prof. Tait—is an unfinished monument to his mathematical ability. His researches on heat have ranked him with Joule and Clausius. It is, however, with his electrical work that we have chiefly to do; and with the practical part of that. To most people his elaborate mathematical investigations into the nature and laws of electricity are a sealed book; but when they yield some formula which is of great practical utility they come within the scope of general interest. Such is his law of the velocity of electric signals through long submarine cables, a law which showed how cables, across the Atlantic or any ocean, however wide, could be worked. Lord Kelvin followed up this law by the invention of the "mirror galvanometer," an ingenious and beautiful instrument whereby the electrical signals through a long submarine cable could be easily read at the other end of

the cable. This instrument rendered the early Atlantic cables economical in working. He obtained the honour of knighthood from Her Majesty, in 1866, along with Sir James Anderson and Sir Charles Bright his colleagues on the first wholly successful Atlantic cable expedition. He was raised to the peerage in January, 1892, taking the title of Baron Kelvin, and a suitable honour was thus conferred upon one to whom electrical and engineering science is so deeply indebted. The connection of Lord Kelvin with the early Atlantic cables determined his genius in a new direction. Henceforth, he gave much of his time to invention; and, after all, the best value of science lies in its application to the bettering of human life. If Lord Kelvin has found out fewer general laws than he might have done, he has given us a number of very useful instruments which enable us to telegraph from continent to continent. His siphon recorder improves upon his mirror galvanometer by writing down the message through long cables instead of flashing it to the eye; his tidal harmonic analyser and tide predictor calculate the height of future tides at any place; his electrometers have greatly assisted electrical measurements; and his new compass is the best in the market. His introduction of pianoforte wire for deep-sea sounding gave valuable aid to submarine cable laying; and his navigational sounding machine is largely used in the Naval and Mercantile Marine. During the last ten years Lord Kelvin, has devoted much time and attention to the production of measuring instruments for electric light purposes. His standard balances are well known and appreciated; and his newer electrostatic potential instruments and electro magnetic voltmeter and ampere meter are to be found in many electric light installations. Within the last two years a new electricity supply meter has been perfected by him, and it is now largely used in electricity supply stations, notably in that of the Corporation of Glasgow. His researches in electrostatics and magnetism were collected and published in one volume in 1872; while his collected mathematical and physical Papers, which he is now putting through the press, have already reached the third volume. Two volumes containing his collected "Popular Lectures and Addresses" have also quite lately been given to the public. The Jubilee prize of £100, given by Dr. Gunning, of the Royal Society of Edinburgh, was awarded to him for a "valuable series of Papers on hydro-dynamics," published early in 1887, and a continuation of these researches appeared in the *Philosophical Magazine* and the *Proceedings* of the Royal Society of Edinburgh. In November, 1891, Lord Kelvin was elected President of the Royal Society. It is unnecessary here to specify the numerous honours that have been bestowed upon Lord Kelvin, as the scientific associations and universities at home and abroad have vied in claiming him as an Associate, but we may mention that he is a Knight of the Order pour le Mérite of Germany, a Grand Officer of the Legion of Honour of France, a Commander of the Order of Leopold of Belgium, and a Foreign Associate of the French Academy.

KENNEDY, Professor A. B. W., F.R.S. Born March 17, 1847, at Stepney. Educated at the City of London School and the School of Mines, Jermyn-street.

Prof. Kennedy served as an engineering pupil for four and a-half years with Messrs. J. and W. Dudgeon, engineers and ship-builders, Millwall. In 1868 he became a leading draughtsman at Palmer's Engine Works, Jarrow; in 1871 chief draughtsman to Messrs. T. M. Tennant and Co., Leith; in 1872 he became consulting engineer in Edinburgh with Mr. H. O. Bennett, as Bennett and Kennedy. In 1874 he was appointed Professor of Civil and Mechanical Engineering at University College, London, the title of the Chair being changed later to that of Engineering and Mechanical Technology. He devised, in 1875, and shortly after established, the Engineering Laboratory at University College, which was the first of the kind in the country. In 1889, owing to the pressure of professional work, he resigned his Chair, but received the honorary title of Emeritus Professor of Engineering from the Council of University College. In 1876 he translated and edited Reuleaux's "Theoretische Kinematik" under the title of "Kinematics of Machinery," and in 1886 he published the "Mechanics of Machinery." Prof. Kennedy has been connected with the Research Committees of the Institution of Mechanical Engineers since their foundation, and as Reporter of the Committee on Riveted Joints carried out an elaborate series of experiments, which are published in the *Proceedings* of the Institution for 1881, 1882, 1885 and 1888. As Chairman of the Committee on Marine Engine Trials he has carried out also a number of extended and very complete trials at sea, the results of which have been published in the *Proceedings* of the Institute of Mechanical Engineers, 1889 to 1892. He contributed a Paper on "Engineering Laboratories" to the Institution of Civil Engineers (*Proceedings*, Vol. LXXXVIII., 1887), for which he was awarded a Telford medal and premium. Among his published experiments are the following:—Tests of the Griffin Gas Engine, the Beck Gas Engine, Easton and Anderson's Pumping Station at Addington, the Popp Compressed Air System in Paris (British Association, 1889, and *Engineering*, September, 1889); the Otto, Atkinson and Griffin Gas Engines, and the Davey-Paxman Steam Engine (Society of Arts Motor Trials, 1888); the Thornycroft Boiler (*Proc.* Inst. C. E., Vol. XCIX.); the Willans Central Valve Engine (*Proc.* Inst. C. E., Vol. XCVI.); the Thomson Electric Welding Process, &c. He has been, since 1878, largely occupied with the practical testing of materials of construction, and has fitted up for himself at Westminster a testing laboratory embodying the results of his experience in this work. He has also acted as engineer-in-chief to the Westminster Electric Supply Corporation (Limited) since its formation, and has designed the whole of its stations. He became a Member of the Institutions both of Civil and of Mechanical Engineers in 1879; in 1883 he was elected an Honorary Life Member of the latter, and is

Digitized by Google

now President-designate. He is also a Member of Council of the Institution of Civil Engineers, and of the Institution of Electrical Engineers, and a Member of the Institution of Naval Architects, and of the Iron and Steel Institute. He was elected a Fellow of the Royal Society in 1887. He has designed electric lighting stations, which are now at work or in process of erection, for the Corporations of Glasgow, Oldham, Aberdeen, Belfast, Sunderland, and Edinburgh, and is a consulting engineer for several electric lighting companies.

KENNELLY, Arthur Edwin. Born in Bombay in 1861. Educated at University College School, London.

Mr. Kennelly commenced electrical work as assistant secretary of the Society of Telegraph Engineers in 1877. He entered the service of the Eastern Telegraph Company as clerk in 1878, serving at Porthcurnow and Malta. Placed as assistant electrician on board the s.s. "Great Northern" in 1880, he remained in that branch of the Company's service. In 1882, he was chief electrician of the s.s. "John Pender," subsequently acting in that capacity on the s.s. "Chiltern," "Retriever" and "Electra," in the Mediterranean and Red Seas, the Indian Ocean and Atlantic. In 1887 he received the premium of the Institution of Electrical Engineers for a Paper on a new method of localising faults in submarine cables, and the Fahie premium of the same Institution in 1889. In 1888, being then senior electrician of the ship staff, he resigned his position in the Eastern Telegraph Company, and became electrician in the laboratory of Mr. Edison at Orange, N.J. He has contributed a number of Papers to electrical journals, and among these his determinations of the carrying capacity of electrical conductors are the most generally known. Mr. Kennelly is a member of several scientific societies, one of the Vice-Presidents of the American Institute of Electrical Engineers and Chairman of its committee on "Units and Standards," an Associate Member of the Institution of Electrical Engineers, and consulting electrician to several corporations.

KIESER, Wilhelm. Born at Isny, South Württemberg, Germany, February 17, 1838; was educated in several good schools, and apprenticed in a manufactory of telegraphic, optical, and mathematical instruments at Stuttgart.

Mr. Kieser was afterwards engaged in the Federal Telegraph Manufactory under M. Hipp, in Berne, and when but twenty-three years of age came over to England. In 1863 the late Mr. Becker, manager to the firm of Elliott Brothers, directed the attention of Mr. Kieser to electrical science, and, under the guidance of the late Prof. Fleeming Jenkin, he was instructed to adjust the various resistances and arbitrary units for the British Association Committee. After being engaged in this branch of electrical work for twelve years, Mr. Kieser left the test-room to become manager of Messrs. Elliott's business.

KING, Frank, M.I.E.E. Born in London in 1854.

Mr. Frank King received a careful training at several private schools, and completed his education at Finsbury College. Mr. King commenced life in a comparatively humble position in the works of a well-known manufacturer of scientific apparatus, where he soon evinced a great aptitude for mastering details and then setting himself steadily to work to perfect what came under his notice. The practical results of this habit have been shown in his many valuable inventions. The introduction in 1881 of Faure's improved secondary battery led Mr. King to direct his energies to the subject of secondary batteries generally. Soon after his return from America, in the spring of 1888, Mr. King joined the Electrical Power Storage Company, taking the position of superintending engineer. He soon found congenial work in improving the "E.P.S." storage battery, and in the following year designed the well-known "1888" E. P. S. type of battery. Mr. King early turned his attention to the two great electrical problems—viz., traction and central station lighting, in both of which secondary batteries would be necessary or useful. In the former he has achieved success by the design and manufacture of the type of battery used on the Barking-road Tramways. With regard to central station lighting, Mr. King's system of automatic distribution as used by the Chelsea Electricity Supply Company has been in successful operation since the early part of 1889. The apparatus is a triumph of skill and ingenuity. The record of reliability is almost unique in the annals of central station lighting, as since its installation there has occurred no failure of the supply nor abnormal fall of pressure of the current in the mains of the Chelsea Company. At the close of 1889 Mr. King transferred his services from the Electrical Power Storage Company to the Electric Construction Corporation, taking up the same position of superintending engineer. Whilst he was with this corporation Mr. King introduced the new "K" type of E.P.S. storage battery, which is capable of being charged and discharged for short periods at four times the rate of the older types of lighting batteries, the normal maximum discharge being double the rate of the former. In 1891 the Electrical Power Storage Company resumed the manufacture of the E. P. S. batteries, under Mr. King's superintendence.

KITTLER, Prof. Erasmus, Ph.D. Born June 25, 1852, at Schwabach, near Nuremberg; educated at the Volksschule and at the Teachers' Seminary at his native place, and was afterwards a master at Nuremberg from 1871 to 1874.

After studying at the Gymnasium there, and afterwards in Munich and Wurtsburg, he passed his Doctor's examinations in mathematics and physics at the latter university in 1880. From 1879 to 1882 he was assistant to Dr. v. Beetz, at Munich, being appointed a Privat docent in 1881, and in 1882 he became professor of electrical engineering at the Grand Ducal Technical High

School of Darmstadt. From October, 1887, to October, 1889, Dr. Kittler was principal of this college, which has now attained great importance, and where in 1891 was constructed an extensive laboratory for electrical purposes. In 1882 and 1883 he was appointed vice-president of the technical scientific juries at the Munich and Vienna Electrical Exhibitions. In 1891 he was appointed president of the jury of the Electro-technical Exhibition at Frankfort-on-the-Main. In addition to the compilation of the "Handbuch der Elektrotechnik" (Handbook of Electrical Engineering) Dr. Kittler is engaged in the designing, examining, and partly superintending of central stations.

KNIGHT, Walter Harris. Born in 1858.

Mr. Knight was educated at Cincinnati University, taking a series of special courses in scientific subjects. He was occupied at various periods in assisting in the preparation of Knight's Mechanical Dictionary, a standard work of which his uncle, Mr. Edward Knight, was the author. From 1880 to 1883 he was Examiner in the department of electricity of the United States Patent Office, after which he associated himself with Mr. E. M. Bentley, with whom he has been connected in the development of the electric railway. In 1883-1884 he constructed, in Cleveland, Ohio, the first American electric tramway, using thereon the underground conduit system. Mr. Knight is at present engaged as engineer of the Railway Department of the General Electric Company.

KOHLFÜRST, Ludwig, retired chief engineer of the Buschtèhrader Railway, was born May 1, 1840, at Graz (Steiermark, Austria).

He attended the Real Academy and the Technical High School at Graz, and in 1862 entered the service of the Emperor Ferdinand Northern Railway as technical officer. A chance meeting with Mr. Hughes in 1867 resulted in his taking up the subject of railway electric telegraphs and signals, and he has since devoted himself to their improvement and development. He has published several Papers and short articles on the subject, amongst them being: "Entwurf einer Normal-Instruction für die Ansüburg des Telegraphendienstes bei Eisenbahnen," "Ueber elektr. Distanzsignale" (Prague, 1878), "Die elektr. Wasserstandsanzeiger" (Berlin, 1881) "Die elektr. Einrichtungen der Eisenbahnen" (Vienna, 1883), "Die Fortentwicklung der elektr. Eisenbahneinrichtungen" (Vienna, 1891), "Die elektrischen Eisenbahneinrichtungen auf der Frankfurter Ausstellung" (Stuttgart, 1892). He collaborated with Dr. Zetzsche in the preparation of Vol. IV. of the well-known "Handbuch der Telegraphie," which treats of railway telegraphs and signals, and for this in 1881 they received an honorary diploma at the Paris Exhibition, and in 1882 they were awarded a prize of M.1,500 by the Verein deutschen Eisenbahnverwaltungen, which society, in 1892, awarded Herr Kohlfürst a similar prize for his book "Die Fortentwickelung der elektr. Eisenbahneinrichtungen."

KOHLRAUSCH, Friedrich, Ph.D., was born in 1840 at Rinteln, on the Weser.

His father, Rudolf Kohlrausch, was the constructor of the first instrument for the measurement of low potentials. He afterwards made measurements of contact potentials, and gave the first experimental demonstration of Ohm's law. From 1850 to 1858 the father taught at the Polytechnic School at Cassel, and at the Universities of Marburg and Erlangen, and it was at these places that the son received his education. Even at this early age he was allowed to assist his father in many of his investigations, for example, in those concerning the electric residual charge. He also helped in preparing for the measurements made jointly by his father and Wilhelm Weber, particularly in the first comparison of the electromagnetic with the electrostatic unit, or the velocity "v" in Maxwell's theory. The father died in 1858, the year in which Friedrich entered the university. The latter studied physics under Beetz in Erlangen, but the greater part of his work was done under Wilhelm Weber in Göttingen. Here he received in 1863 the degree of Ph.D., having as the subject of his dissertation the elastic after-effect. For a short time after this he held the position of assistant in the Göttingen Astronomical Observatory. From 1864 to 1866 he was instructor in physics in the Physikalischer Verein at Frankfort-on-the-Main, and then returned to Göttingen to become Weber's assistant; he was also made privat docent and professor extraordinarius. From 1870 to 1871 Kohlrausch was professor in the Polytechnicum at Zürich, and from 1871 to 1875 in that of Darmstadt. He was then called to the University of Würzburg, where in 1879 a new physical laboratory was erected according to his plans. In 1888 he became professor at the Kaiser Wilhelm's University of Strassburg, which position he now holds. As a teacher Kohlrausch has always laid especial emphasis on the importance of practical physics. The first systematic course of instruction in this department he organised at Weber's suggestion in Göttingen in 1867. From this originated in 1869 his "Leitfaden der praktischen Physik," the pioneer among works of its kind. Besides the six German editions of this book there have appeared two English editions of a translation by Waller and Procter, and it has also been translated into French, Russian and Hungarian. In reviewing briefly Kohlrausch's more important contribution to science, special mention should be made of his work on elasticity, embracing a series of investigations concerning the elastic after-effect and the influence of temperature. He has also successfully applied the principle of total reflection to optical measurements. But the greater number of his scientific investigations refer to electricity and magnetism; they introduce new methods and new instruments for the observation and absolute measurement of the periodic and local variations of the earth's magnetic force; also for the absolute measurement of electrical current strength and resistance for scientific or technical purposes. These methods

Digitized by Google

have been applied by Kohlrausch in his determination of the electro-chemical equivalent and to the absolute electrical resistance of mercury ("Determination of the Ohm"). For the measurement of the resistance of electrolytes he introduced alternating currents, using as an instrument of observation the dynamometer or the telephone. By means of this delicate method he has conducted numerous investigations concerning the conductivity of water and aqueous solutions of electrolytes; he has investigated the electromotive force of very thin gas films on the electrodes, and established the validity of Ohm's law for electrolytes. He has published theoretical investigations on the movement of the electrolytic ions, and on thermo-electricity. His writings have been published in the *Annalen der Physik und Chemie* of Poggendorff and Wiedemann, in the *Electrotechnische Zeitschrift*, and in the publications of the Berlin, Göttingen, and Munich Academies.

KOHLRAUSCH, Wilhelm Frdr., Doctor of Philosophy, Professor of Electrical Engineering at the Royal Engineering High School at Hanover, was born at Marburg in Hesse, May 14, 1855.

He studied at the Gymnasium at Hanover, and from 1874 to 1878 at the Polytechnic at Darmstadt and the Universities of Göttingen and Wurzburg, graduating as Doctor of Philosophy at the latter. In 1878 Kohlrausch was appointed second assistant to Prof. Kundt at the Physical Institute of the University of Strasburg, and in 1879 he was made first assistant. At Easter, 1883, he was chosen as special Professor for Theoretical Physics at the same University. At this time he had already devoted much attention to electrical matters, and had delivered many lectures on the subject. In 1884 he was appointed Professor of Electricity at the Royal High School of Hanover, a chair having then been founded for this branch of science. In July, 1892, he was appointed Rector for a period of three years. His treatises on the optics of crystals, acoustics, electricity and magnetism have been published in "Wiedemann," whilst his works in regard to the electrical measurements of dynamos, and others, have appeared chiefly in the *Electrotechnische Zeitschrift*.

KRAUSE, Rudolph Howard. Born in 1857. Went with his parents to Australia and the South Sea Islands; was sent to Germany to be educated, first entering the Grammar School in Bayreuth, and later the Moravian College in Niesky, Silesia, and returned to England after having completing his education in 1876.

Mr. Krause spent two years in the chemical works of Messrs. Howards and Sons, of Stratford, and in 1878 joined the original Edison Telephone Company of London, Limited, where he first occupied his attention with electricity, and took an active part in the first introduction of telephones in London. Some time later the United Telephone Company, Limited, took Mr. Krause into their service, and he acted for nearly a year as their secretary. He left this company to become secretary to the Edison Gower-Bell Telephone Company of Europe, and visited Belgium, Russia, and Austria in their interest; he also took an active part in forwarding the development of the exchanges in Lisbon and Oporto. He was appointed secretary to the River Plate Telephone Company, and filled that post to their entire satisfaction, but gave up both these appointments in 1883 at the request of the Consolidated Telephone Construction and Maintenance Company, Limited, in order to take the management of their numerous exchanges in Austria, which he had started, and which were transferred to the Telephone Company of Austria, Limited, of which company Mr. Krause acted as general manager. The greater portion of the Austrian telephone exchanges having been taken over by the Government on January 1st, 1893, Mr. Krause joined the Board of the Vienna Private Telephone Company as Managing Director. This Company owns the telephone exchanges of Vienna, with nearly 8,000 subscribers. He is a member of the Institution of Electrical Engineers, and their local hon. secretary and treasurer for Austria; a member of the Society of Civil Engineers and Architects of Austria, of the Electro-Technical Societies of Vienna and Berlin, and of several other scientific Societies.

LAISTER, James. Born 1837, at Burnham, Isle of Axholme, Lincolnshire. Educated at private school and City of London College.

For many years Mr. Laister was the Superintendent of the Post Office Telegraph Schools in London, a position which he had occupied from the time of the acquisition of the telegraphs by the State in 1871, at which period he took a prominent part in organising telegraphic instruction both in England and Ireland, to meet the large increase of force consequent upon the introduction of the shilling tariff. He had been previously in the employment of the Electric and International Telegraph Company, whose service he entered at a very early age. In October, 1889, Mr. Laister was appointed District Postmaster of Norwood, and in April, 1892, he became Postmaster of the Northern District of London. Mr. Laister is a member of the Institution of Electrical Engineers, and a contributor to various journals and magazines, both scientific and literary.

LANGDON-DAVIES, Charles. Born July 29, 1841, at Bristol. Educated by private tutors, receiving his early scientific training from the late Dr. David Mackie, F.R.S.E.

Accustomed to mark out his own course of study and to follow it alone, Mr. Langdon-Davies may be said to have been always more or less engaged in original research. Electricity was one of the subjects which early occupied his attention. About 1855 he turned his attention to the construction of a dynamo machine, but found that others were working on similar lines and obtaining similar results. In 1860 Mr. Langdon-Davies patented a self-acting printing machine, believed to have been the first apparatus which took up the material

Digitized by Google

to be printed, piece by piece, and carried it through the entire operation without being touched by hand. A small example of the machine, which could be held on a man's palm, was exhibited at the Society of Arts, printing 12,000 cards an hour. It has since been preserved in the South Kensington Museum. This machine was the basis of the automatic card printing machines now in general use, and its feed apparatus has been adapted to much of the automatic machinery lately so popular. At the time of the conversion of the old copper into the new bronze coinage, Mr. Langdon-Davies entered the service of the Royal Mint, where he devised an apparatus for counting the coins which was approved by Professor Graham, then Master of the Mint, who, in acknowledgment of these and other services, expressed his intention to promote Mr. Langdon-Davies to an important post in the establishment. He was, however, detailed for a time from the Royal Mint staff to assist in the organisation of the English Mint then projected for Hong Kong, and eventually elected to accept the post of Superintendent of the Bullion Office there, which was offered to him by the Secretary of State for the Colonies. After living for six years in China, where he established the *China Magazine*, he returned to England in 1871. In 1875 he worked out improved processes for preserving masonry and ironwork from decay, which are in successful use all over the world. The electric telephone next claimed Mr. Langdon-Davies' attention, but although numerous improvements were the result of his researches, the course adopted by the United Company led him to avoid the risk of litigation, by continuing his experiments abroad and afterwards by laying them aside until the end of 1892, when they were resumed. Mr. Langdon-Davies gave considerable attention to the phenomena of induction, and sought to overcome the obstacle to good telephones arising from the induction noises caused by telegraph currents passing in the neighbourhood of telephone conductors. Finding the difficulties great, he determined to try to turn that form of induction to some useful purpose, and invented the Phonopore. He has since designed a complete series of telegraph instruments on the phonoporic system for simplex, duplex, and multiplex telegraphy, all capable of being put in independent action on the same wire as that on which any ordinary electric telegraph is, at the same time, working. The phonoporic instruments form the subject of about a hundred patents. They are in practical use in many countries, and constitute the only multiplex system which really doubles the user of a telegraph wire. Mr. Langdon-Davies has for some years been investigating the retardation of currents in submarine cables with the view of elaborating a rapid submarine telegraph. He has also produced a new microphone induction coil, composed of a multiple primary of negligeable resistance, and a phonoporic secondary of practically infinite resistance. This is used on railway block signal wires for simultaneous telephonic communication, and it constitutes a very loud-speaking telephone for general use.

LAURITZEN, S.

Up to the year 1882, Mr. Lauritzen was the engineer of the Great Northern Telegraph Company at Copenhagen. He is the inventor of the undulator, a telegraphic receiving instrument in use on all the Great Northern Company's cables. Mr. Lauritzen is now a member of the firm of Kemp and Lauritzen, of Copenhagen.

LAVENDER, John, M.I.E.E., M.S.A.

Born at Lichfield, Staffordshire, 1829; educated at private schools.

He went to sea at an early age, and in 1850 joined the staff of the British Telegraph Company, which was formed to work Highton's patents, consisting of his one-wire system, worked by single-needle instruments, and his tapper keys. In these early days, owing to the monopoly conceded to the Electric Telegraph Company, the British Company were compelled to fix arms on poles in a cross-wise position, and to extend their wires in a similar way. Thus the top front wire on one pole would become the second front wire on the next pole, and so on, reversed at the third pole. The lines had to be constructed under these unfavourable conditions for some three or four years, and modern telegraphists can well realise the difficulty of discovering a "contact on the line." The insulation was effected by means of a silk ribbon passed round the line wire about 16in., and covered with a cone-shaped insulator of hot gutta percha. When this gutta percha was cold it was screwed down firmly to the end of the arm, and a coat of shellac varnish completed the appliance. In 1854 Mr. George Seward, the then secretary, negotiated for the purchase of the European Company's underground system. It consisted of six bare gutta-percha wires placed in a V-shaped trough and laid down between London, Birmingham, Macclesfield, Manchester, and Liverpool. In a very short time these wires completely failed, but the company having powers for turnpike-road work, Mr. Lavender, in 1858, constructed the first three sections of the overhead line from Manchester to London, viz.: Poynton two miles, Newcastle five miles, and Stoney Stratford three miles. Prior to this he had been engaged in the construction of the first line of telegraph ever erected on a turnpike road. In 1853 he was engaged in the construction of the line between Hull and Goole; while at Howdendyke he took a prominent part in the erection of lower and top masts to carry wires at a height of 140ft. above the level of the Humber. In 1854 Mr. Lavender inaugurated the over-house system by erecting wires which communicated between the Halifax Railway Station and a place of business in the centre of the town. In 1859 he superintended the over-house work in connection with the Ashton and Stalybridge Railway. Up to this time 60ft. and 70ft. poles had never been used; they would have been too costly. Mr. Lavender mastered the difficulty by the simple but ingenious contrivance of splicing 30 and 40ft. poles. In 1862 he erected the first over-house work in Manchester, carrying sixteen lines from Ducie Place to Salford Station, and

Digitized by Google

eight wires from Ducie Place to Ardwick Green. In 1864 Mr. Lavender was engaged in over-house work first at Stockport and then at Newcastle, where 60ft. and 70ft. poles were first used. At Coventry he made the experiment of fixing the arms on one side of the poles only, and this system has since been generally adopted. After devoting sixteen years to over-house, underground, and other telegraphic lines, Mr. Lavender was appointed to take charge of the Leeds district. In 1867 he removed to Cambridge, where he had the entire control of the turnpike road lines between London and Doncaster, Cambridge and Cromer, and Norwich and Yarmouth. Shortly after the transfer of the telegraphs to the Government he was permitted to retire, and in 1872 he joined the Lancashire and Yorkshire Railway Company. After reconstructing the whole of this company's lines, he left the service in order to undertake the extensive electrical arrangements in the new Manchester Town Hall, and those of the West Lancashire Railway Company, the Euston Hotel, London, and innumerable smaller systems. At present Mr. Lavender, who resides near Manchester, is engaged in constructing and carrying out telegraph and telephone systems for the Mersey Tunnel Railway Company, Liverpool and Birkenhead, West Lancashire Railway Company, and other telegraph works. In addition to the above, he represents the firm of Messrs. John Birch and Co., merchants and engineers, of London, as electrician in Manchester.

LAWRENCE, H. Newman. Born in 1851. Educated at the Perse Grammar School, Cambridge, in which town he assisted his father in business for some years.

In 1883 Mr. Lawrence came to London and studied electrical science at the City Guilds Technical College, Finsbury, where he in due course obtained the Certificate in Electrical Engineering, and was placed first on the list for laboratory work. During his second year as a student he was appointed student-in-charge of the electric lighting of the college, and for two sessions following held the post of assistant-instructor in mathematics to the evening classes. On leaving college Mr. Lawrence became assistant and secretary to Mr. J. G. Lorrain, consulting engineer. In 1888 he founded, and was appointed Managing Director of, the Institute of Medical Electricity, which had for its object the development of electro-therapeutics by electricians and medical men conjointly. Mr. Lawrence is author of "A Handbook for Operators in Medical Electricity and Massage," "The Current that Cures," and a Paper on "The Human Body as a Conductor," read before the British Association, 1892. He is joint author of "Practical Lessons in Electro-Therapeutics," and the following papers: "Alternating *v.* Continuous Currents in Relation to the Human Body" (battery and coil currents), read before the Institution of Electrical Engineers in March, 1890; "Alternating *v.* Continuous Currents in Relation to the Human Body" (dynamo currents), read before the British Association in September, 1890; and "Electricity in Relation to the Human Body (its dangers and its uses)," read before the Society of Arts. Mr. Lawrence has invented and patented an electro-gymnastic apparatus, an electric douche, and an ozonised cabinet for therapeutic purposes. He has also, in conjunction with another, developed from its experimental to a practical stage the use of electric endosmose for medical purposes, and introduced a method of treatment based thereon under the title of "Cataphoric Medication," or the local administration of drugs through the skin. Mr. Lawrence is a member of the Institution of Electrical Engineers, a Fellow of the Imperial Institute, in 1891 founded and became first chairman of the Society of Operators in Medical Electricity and Massage, and in 1893 was one of five electrical experts elected Fellows of the American Electrotherapeutic Association.

LAWTON, George F. Born 1849. Educated privately in England by the Rev. G. Stokes, and in France.

Mr. Lawton was with the late C. F. Varley in 1868-9; then joined the Anglo-Mediterranean Telegraph Company. He was at Malta and on board the steamship "Hawk" till 1871; at Suez 1871-74, as assistant to Mr. H. A. C. Saunders, electrician-in-chief of the Eastern Company. He was subsequently attached to the steamship "Chiltern" from June to October, 1874. He went to Marseilles in December, 1874, introducing the first syphon recorder into France. Assisted Dr. Alex. Muirhead, Mr. J. Munro, and Mr. Herbert Taylor in the preliminary experiments and final adoption of the duplex system to submarine cables. He was appointed manager January, 1885. He is a member of the Physical Society of France.

LE FEVRE, W. H., Civil and Mechanical Engineer. Born at St. Peter's, in the Island of Jersey, in 1840; educated at Victoria College, and there took high mathematical honours; graduated at the University of London; articled to Mr. William Dempsey, C.E., of Great George-street, Westminster.

On the expiration of his term of articleship Mr. Le Fevre left for Africa, and was employed in the laying out and construction of the Algerian Railways system; subsequently the Tunis Railways and Gas Works and Egyptian Railways. Mr. Le Fevre also practised in Westminster as a parliamentary and railway engineer, and was engaged (amongst others) on the following railways and public works:—Cape Railways, Table Bay Harbour Works, Italian Railways, Great Indian Peninsula Railway, Victoria Railways, Jersey and Guernsey Telegraph, Herne Bay Waterworks, Buenos Ayres Railway, Bombay Gas Works, Welsh Coast Railway, Halesowen Railway, Mauritius Railways, and the Kurrachee Waterworks. Mr. Le Fevre was in partnership with Mr. R. M. Ordish, Mr. Carrington, and Mr. Robertson, and carried out the following works:—Amsterdam, Crystal Palace, International Exhibition (1862), Dutch-Rhenish Railways, Oporto Crystal Palace, Tudela and Bilbao Railway, Albert Bridge, Chelsea, Dublin Crystal

Digitized by Google

Palace, Derby Market Hall, Rangoon Wharf, Prague Bridge, and Leeds Exhibition. He was for many years member of the Council of the Society of Engineers, and in 1867 was elected president, also honorary member of the Society of French and German Engineers. He has devoted much attention to aerial navigation; was elected a member of the Council of the Aeronautical Society of Great Britain, honorary member of the Académie d'Aérostation Météorologique de Paris, and is president of the Balloon Society of Great Britain.

LIEB, John W., Jun., graduated as Mechanical Engineer from the Stevens Institute, Hoboken, N.J., in 1880.

Spent six months as draughtsman in the works of the Brush Electric Company, Cleveland, Ohio. Entered the Engineering Department of the Edison Electric Light Company as draughtsman in 1881; transferred to the Testing Department and Experimental Laboratory of the Edison Machine Works in 1882; subsequently appointed by Mr. Edison to superintend the installation of the electrical plant in the first Edison Central Station in New York, and on the inauguration of its regular service was appointed its first electrician. In 1882-83 was sent to Milan, Italy, by Mr. Edison to direct the installation of the Milan Edison Station. On the organisation of the Società Generale Italiana di Elettricita Sistema Edison he was appointed chief engineer of the Company, and director of the Milan Stations; and for some years he directed the mechanical and electrical equipment of those stations, and the installation of the overhead and underground conductors supplying current on the Edison, Thomson-Houston, and Zipernowsky-Déri alternate current systems. Mr. Lieb is a member of the American Society of Mechanical Engineers, of the American Institute of Electrical Engineers, and of the Italian Society of Electricians.

LOCKWOOD, Thomas D. Born in Birmingham, December 30, 1848. Had a very slender school education to start with, and began work for a living in 1859.

His first employment was washing emery for use in the manufacture of plate glass at the Birmingham Plate Glass Works, after a year of which he entered the machine shops of the manufactory and worked there, learning and practising the trade of machinist, until 1865, when, with his father's family, he sailed for North America. He resided for some time at Port Hope, Ontario, Canada, where, after a short spell in the machine shop and tannery, he learned the art of telegraphy. He became the first operator at Port Hope for the Provincial Telegraph Company, a short-lived concern, afterwards swallowed up by the Montreal Telegraph Company. Thrown out of employment in 1867 by this consolidation, young Lockwood, unwilling to be idle, took the first work that offered, and became a finisher in the paper mills of the Smith Paper Company, of Lee, Mass. In 1869 Mr. Lockwood, ever on the watch for opportunity, went west to New Albany, Indiana, where he aided in the establishment of a manufactory of polished plate glass. This was the first concern of the kind in the United States, and Mr. Lockwood wrote the order to England for the importation of the first machinery used in that country for the purpose. This factory afterwards developed into the Star Glass Works where the late W. C. De Pauw made some of the millions with which he endowed so liberally the De Pauw University. It was at New Albany that Mr. Lockwood made his *début* in literature, by contributing to the *Scientific American* an excellent four-column article on the manufacture of plate glass. In 1872 Mr. Lockwood went east again, working his passage, and engaged in the employ of the Housatonic Railroad, serving consecutively as ticket clerk, freight clerk, and telegraph operator at Lee and Bridgeport, and as chief clerk and paymaster in the master mechanic's department, besides acting on trains in various capacities, from brakeman to engineer. Reaching New York in 1873, Mr. Lockwood engaged with the Automatic Signal Telegraph Company, a private fire alarm service, as inspector; and he was then called to positions of higher responsibility with the Gold and Stock and American District Telegraph Companies. At this time—1874 to 1877—these companies were the best schools of practical telegraphy and electrical application in the country, and Mr. Lockwood, always anxious to learn, proved an apt scholar. It was here that he gained the immense experience in the management and arrangement of circuits that made him invaluable when the telephone was introduced. One of the effects of the invention of the telephone by Prof. Bell was to drain the telegraphic field of many of its best and brightest spirits, and it was thus that, in 1879, Mr. Lockwood came to accept a position with the National Bell Telephone Company, which a little later organised as the American Bell Telephone Company. For some time he acted as technical inspector of exchanges, but in 1881 the company decided to organise a Patent and Technical Information Bureau, at the head of which Mr. Lockwood was placed. Here he was emphatically the right man in the right place. At the present time he has charge of the Patent Department of the American Bell Telephone Company at the headquarters in Boston, acts as one of the electricians of that company, and also as advisory electrician for the Bell Telephone Company of Canada, and for the Western Electric Company of Chicago and New York. It is needless to say that the duties of such positions involve the exercise of many rare and special qualities, and exact an unremitting attention to subjects of the utmost importance. One of the first of Mr. Lockwood's literary labours was the "Notes and Queries," published chiefly in *The Operator*. The next was a series of valuable articles specially relating to practical telephony, also published in *The Operator* and issued in book form as "Practical Information for Telephonists," which has had a large circulation. The third noteworthy production is the well-known "Text-Book of Electrical Measurements." Mr. Lockwood has also contributed to the technical journals innumerable

Digitized by Google

articles, not simply on telephonic topics, but on subjects of general and vital interest to electricians at large. Besides working and writing, he has found time for a little inventing. He has taken out 22 patents in all, in 19 of which he appears as the sole inventor. All are for telephones and telephonic appliances but two, these latter being for a burglar alarm and a district system. It was also Mr. Lockwood who first applied the Wheatstone bridge system to the burglar alarm service. Mr. Lockwood is an honorary member of the National Telephone Exchange and National Electric Light Associations, and a foreign member of the London Institution of Electrical Engineers. In 1884 he was, by request, one of the authors of Papers read before the International Electrical Conference at Philadelphia. In the winter of 1885, he was lecturer before the Lowell Institute on telegraphy and the telephone. He was a charter member of the American Institute of Electrical Engineers, and has twice been vice-president of that Society.

LODGE, Prof. Oliver J., D.Sc., F.R.S., M.I.E.E. Born June 12, 1851, at Penkhull, near Stoke-upon-Trent.

Educated at Newport (Salop) Grammar School. He was at fourteen put into business with his father in the Potteries, and remained there for six or seven years. During this time he made his first acquaintance with science by reading an odd monthly number of the *English Mechanic*, and afterwards picking up what he could from the articles of the "Penny Cyclopædia." Later, while on a visit to London, he attended a private course on elementary chemistry. He then attended evening classes in chemistry under the Science and Art Department at the Wedgwood Institute, Burslem; and in 1872 was permitted a winter's course at the South Kensington Chemical Laboratory, on the annual examination list, of which he came out bracketed first. In 1871, by working at odd hours, he matriculated at the University of London, and after two years of private study passed the intermediate examination for a science degree. In this examination he obtained honours in chemistry and physics, standing alone in the first class in the latter subject. He next tried for a scholarship at St. John's College, Cambridge; but, not succeeding in getting nearer than *proxime accessit*, he went to study mathematics at University College, London, where Prof. Carey Foster enabled him to live without much home aid by teaching in exercise classes. In 1875 he took his B.Sc. degree; and the post of Demonstrator of Physics at University College was created and offered to him about the same time. In the same year he published, in conjunction with Prof. Foster, several Papers on the flow of electricity in a plane conductor, in which the forms of the lines of flow and equipotential lines are found practically and mathematically for various shapes of conductor, and for different positions of the electrodes. In 1876 he read and analysed the first volume of Maxwell's Electricity, and the same year he exhibited before the British Association a model, the purpose of which was "to illustrate mechanically the passage of electricity through metals, electrolytes, and dielectrics, according to Maxwell's theory." In June, 1877, he published a Paper describing a modification of Mance's method for measuring battery resistance, in which a condenser and galvanometer are used in place of the ordinary Wheatstone's bridge galvanometer. Later in the year appeared his suggestion for a standard Daniell cell, in which the copper sulphate solution is prevented from getting to the zinc rod either (1) by having to diffuse through a very long column of zinc sulphate; or (2) by connecting the two liquids by a fine capillary layer of sulphate of zinc. In the same year he took his degree of Doctor of Science, choosing Experimental Electricity as his special subject. In 1877 he became Assistant Professor of Physics at University College, and undertook lecturing duties; he was also Lecturer in Physics at Bedford College, London; and in addition to these appointments, he assisted the late Prof. W. K. Clifford in the Mathematical Department of University College, and wrote an elementary book on "Mechanics" for Messrs. Chambers. The original work of this period was an extended series of observations on the thermal conductivity of metals and crystals. In November, 1879, Dr. Lodge undertook the measurement of the resistance of some alloys of copper and tin made by Prof. Chandler Roberts. About this time the telephone and the Hughes induction balance came into prominence, and directed the attention of physicists more closely to the phenomena of self and mutual induction. Moreover, the article of Chrystal in the "Encyclopædia Britannica" shed a clear light on the subject, and obtained many new readers for the hitherto uncut pages of the second volume of Maxwell. Amongst other things, it led Dr. Lodge to publish a mathematical theory of intermittent currents and the induction balance. The facts observed by Hughes were here accounted for and somewhat extended. The effects of making and breaking a circuit were also discussed more fully than in Chrystal's article. But possibly the greatest value of the Paper lay in the fact that it familiarised students with the nature and action of self and mutual induction in closed circuits. In 1881 Dr. Lodge was elected to the Professorship of Physics and Mathematics at the new University College in Liverpool. During the greater part of the college session 1881-2 his time was occupied in superintending the construction and equipment of the Physical Laboratory. In addition to this he delivered all the courses of lectures both in Physics and Mathematics. At the end of a year the Chair of Mathematics was endowed, and Prof. Lodge was thus relieved of this part of his onerous task, retaining the Professorship of Physics, which he still holds. He then commenced a series of experiments to ascertain the behaviour under different circumstances of secondary cells with plates of various materials and with different liquids, and acted as scientific adviser to the Electrical Power Storage Company during the two years

Digitized by Google

1884-86. In 1884 he took out a patent for the use of mercury sulphate along with zinc negatives in secondary cells. He likewise found, among other things, that plates of zinc and peroxide of lead in sulphuric acid gave a steady electromotive force of about 2·5 volts, the highest which he could obtain from any single practicable cell. He proved experimentally that the reason of the sudden drop in the E.M.F. of ordinary secondary cells was the scumming over of the negative plate with sulphate of lead. In the spring of 1883 Prof. Lodge secured the friendly co-operation of the late Mr. J. W. Clark as demonstrator; and in 1884 published, in conjunction with him, a Paper on the behaviour of dusty air near illuminated bodies. At the British Association Meeting at Montreal in 1884 he was chosen to deliver one of the evening discourses, and took for his subject "Dust." In addition to this he was one of the secretaries of Section A, and also opened the first formal discussion ever held in that Section. The discussion was "On the Seat of Electromotive Force in the Voltaic Cell." The discussion was followed a little later by a Paper from Prof. Lodge on energy paths in voltaic circuits, showing how Poynting's views enabled a clear statement to be made. After the success of the 1884 discussion Dr. Lodge established his reputation as a controversialist, and was asked to open a discussion on Electrolysis at the next (Aberdeen) meeting of the Association. In it he reviewed the state of electrolytic theories up to that date, and after the discussion took up the subject with a view to obtaining data for the rate of migration of ions in electrolysis. Indeed, during the years 1886-7 his experimental work was mainly devoted to the subject of electrolysis. In these two years a considerable portion of his time was taken up by the duties of the Electrolysis Committee, of which he was a secretary. For the 1886 Report he translated and reviewed several foreign memoirs on the subject. In the autumn of 1887 Prof. Lodge began his researches on waves in conductors and on Leyden jar discharges. The first experiments were described in the Dr. Mann Lectures, which were delivered before the Society of Arts in March, 1888. Since that time his experiments have proved that pulses travel along isolated wires with the velocity of light, and he has investigated the conditions indicated by theory and perfectly borne out by fact, under which an electrical discharge is oscillatory in character, and has shown that the case of a lightning discharge may, and in general does, satisfy those conditions. He has always emphasised the fact, first clearly published by Heaviside in the columns of *The Electrician*, that oscillatory discharges or impulsive rushes tend to keep to the outside of a conductor, and his most recent communication on the subject was mainly directed to showing how a closed conductor may be used to afford protection from a lightning flash to telegraphic installations. The interest of these experiments was greatly increased by the discussion at the British Association at Bath in 1888 on Lightning Conductors, in which Dr. Lodge again took a leading part. At the end of 1887 Prof. Lodge published in *Nature* his views on the ether theory, and the mechanics of the propagation of light and electricity. These articles were collected into a book, and issued in 1889, under the title "Modern Views of Electricity." In 1889 he applied his Leyden jar experiments to a measurement of the value of "*v*," the ratio between the electrostatic and electromagnetic units of electricity, working in the Cavendish Laboratory, Cambridge, in conjunction with Mr. Glazebrook. The clear, terse way in which Dr. Lodge sets forth his ideas and describes his experiments has awakened in the minds of many an interest in his work which the ordinary theorist finds himself unable to create. This lucidity of statements contributes greatly to his success as a controversialist, while in his college lectures it is especially felt and appreciated. Moreover, it makes him welcome everywhere as a writer or lecturer on scientific subjects. To his assistants his unceasing thoughtfulness, kindness, and sympathy render him something more than a friend. The quality and quantity of his work serve to place him in the very foremost rank of the younger School of Physicists. Dr. Lodge is one of the Examiners in Sound, Light, and Heat for the Government Science and Art Examinations, and has been elected an Examiner in Physics at the University of London, having previously (1876-79) held the post of Assistant Examiner. As Professor at one of the three constituent Colleges he is also an Examiner for Victoria University. In 1885 he was one of the jurors at the International Inventions Exhibition, and wrote for the official handbook a short article on progress in electricity during the past 25 years. In the spring of 1888 the University of St. Andrews conferred upon him the honorary degree of LL.D., and shortly afterwards he was admitted a Fellow of the Royal Society. He has been a member of the Physical Society since 1875, and is now a vice-president. He is also President of the newly-formed local Physical Society at Liverpool. In connection with the British Association, besides the offices already mentioned, he was one of the secretaries of Section A from 1878 to 1884, and has served on many committees. Prof. Lodge is also a Member of the Institute of Electrical Engineers. Moreover, he is interested in the subject of hypnotism, and has communicated Papers at various times to the Society for Psychical Research, of whose council he is a member. In 1891 he was President of Section A of the British Association, at Cardiff. His lectures at the Royal Institution have been on the deposition of dust and fume by electricity, on fuel and smoke, on the ether, on the Leyden jar, on aberration and the motion of the Earth through the ether. On the two last subjects he has communicated long memoirs to the Royal Society. Messrs. Whittaker have lately published, with the authority of the Society of Arts, Dr. Lodge's lecture on Lightning Conductors, together with much additional matter, and a Paper on Lightning Guards for Telegraphic Purposes, which he read to the Institution of Electrical Engineers. These guards are available for cables, for tele-

Digitized by Google

phones and instruments generally, and for electric lighting circuits; and they are on trial in several important stations. Another book just published by Messrs. Macmillan is a series of studies in scientific history as illustrated by the lives and work of the great astronomers, called "Pioneers of Science."

LORRAIN, J. G., youngest son of the late Dr. W. B. Lorrain, M.D., a well-known physician and naturalist, and grandson of the late Dr. William Lorrain, M.A., LL.D., Head Master of the Glasgow Grammar School, whose revisions of the texts of Virgil, Sallust, and Ovid are still well known to classical scholars.

Mr. J. G. Lorrain commenced the study of engineering as pupil of Mr. Edward Sang, C.E., of Edinburgh, after which he became a pupil of Prof. Fleeming Jenkin, F.R.S. Studied at Edinburgh University for two years, obtaining "passes with distinction" in mathematics, physics, and mechanics. In 1871 went to University College, London, and studied there for 18 months, and then to the Royal School of Mines for three years, working chiefly at chemistry, mineralogy, mining, metallurgy, and geology. Afterwards went to Paris, and attended lectures at the College of France for two terms. Was then appointed chemist to the Oakbank Works, Midcalder, after which he started in private practice in Edinburgh. Mr. Lorrain erected the first telephone lines in Scotland, and in July, 1879, started the Manchester Telephonic Exchange—the first exchange formed in Europe—and soon afterwards the Liverpool Exchange. In November, 1879, Mr. Lorrain founded and was consulting engineer to the Scottish Telephonic Exchange, Limited (now merged into the National Telephone Company, Limited), for which company he established the Edinburgh, Dundee, and Belfast Exchanges. In 1880 he founded and was consulting engineer to the Anglo-Indian Telephone Company, Limited—the pioneer telephone company in India—which company soon afterwards amalgamated with the Bell and the Edison syndicates to form the Oriental Telephone Company, Limited. In 1881 Mr. Lorrain commenced private practice in Westminster as a consulting engineer and patent agent, acting as consulting engineer to a large number of important undertakings. He is a Member of the Institution of Electrical Engineers, a Member of the Institution of Mechanical Engineers, a Fellow of the Royal Physical Society of Edinburgh, a Fellow of the Chartered Institute of Patent Agents, a Member of the Société Française de Physique, a Member of the Society of Chemical Industry, &c.

LUNDBERG, A. P. Born and educated in Sweden, and apprenticed to a scientific instrument maker.

At the end of his apprenticeship, Mr. Lundberg received the silver medal from the Society of Arts and Trades for excellence of workmanship for work submitted and good conduct during apprenticeship. A year afterwards he received a premium from the Swedish Government, which enabled him to visit foreign countries, and during the following three years was employed in various workshops in France, England and Germany. After a visit to Russia, he returned to England in 1862, to visit the International Exhibition held in London, and he has remained employed in England or for English firms ever since. He was the principal maker of Mr. Scheutz's calculating machine, which was sold to the Albany Observatory U.S.A., but a *fac-simile* may be seen at Somerset House. Between 1862 and 1882 he was employed by several important firms in the capacity of workman and foreman. At the commencement of the International Electric Exhibition held at Paris in 1881, he was sent by Messrs. Crompton and Co. as their assistant to the said Exhibition, and on his return he started a small but successful business for manufacturing electric light fittings, switches, holders for incandescent lamps, wall sockets, &c., which has since been considerably extended, and in which he is assisted by his two sons, Messrs. Gus C. and P. A. Lundberg. Mr. Lundberg exhibited at the International Inventions Exhibition, 1885, chiefly electric light switches, lampholders, and an arc lamp of his own invention, and was awarded a bronze medal. One particular switch exhibited there has been well received by electrical engineers and consumers of the electric light, both at home, on the Continent, and elsewhere, and over 100,000 of the original design, or its numerous modifications, have been sold since its introduction in 1883. Other specialities in electrical fittings have also been well received. Mr. Lundberg was awarded a medal for numerous improvements in electric light fittings at the Crystal Palace Electrical Exhibition of 1892. Amongst the apparatus was the "Unique" switch, which has received a large amount of attention from electrical engineers and from the technical press. This switch, for which Mr. Lundberg has taken out patents in the principal countries of Europe and in America, is of the "one direction" type, and has had a large sale, Mr. Lundberg himself having sold over 45,000, and licensees are also working under the same patent in Great Britain, France, Sweden, Austria and Hungary. Mr. Lundberg may take credit for having executed many pieces of good work, and for having devised various improvements and inventions; and as an industrious and ingenious worker he has taken an honourable place.

LUNDBERG, Gus. C., son of Mr. A. P. Lundberg. Born in London, 1867. After obtaining an "Aske" Scholarship, he entered the schools of the Haberdashers' Company in London.

Leaving school in 1882, Mr. Lundberg was apprenticed to his father, and remained with him for six years. He received the certificates of the City and Guilds in the Ordinary and Honours Grade, and a bronze medal for electric Lighting and Transmission of Power. In 1888 he went to the United States, and entered the employ of the Bentley-Knight Electric Railway Company of Alleghany as electrician, and while with them he experienced the diffi-

Digitized by Google

culties occurring in the early days of electric railway work. The line erected there was worked on a combination of the overhead and conduit systems, and was one of the pioneer applications of electricity for tramway work in the States. At the end of 1888 Mr. Lundberg was transferred to the New York factory of the Company, and while there had charge of the motor-testing and wiring department. On the combination effected between the Thomson-Houston and Bentley-Knight Companies, the staff of the latter was transferred to Boston, Mass. While in Boston Mr. Lundberg acquired considerable experience in equipping the street car system of the West End Street Railway Company with electric motors. Leaving Boston, Mr. Lundberg was engaged for some time on experimental work on the system of the Baltimore and Ohio Railway Company in Staten Island, N.Y. He returned to England in 1890, and re-entered his father's works as his assistant.

MACDONALD, Colonel and Brigadier-General The Right Hon. John Hay Athole, P.C., Q.C., C.B, LL.D., F.R.SS. (L. & E.), M.I.E.E., Lord Justice-Clerk of Scotland, and Lord President of the Second Division of the Court of Session; son of Matthew Norman Macdonald Hume, Esq., W.S., of Ninewells, by his wife, Grace Hay, daughter of Sir John Hay, of Smithfield and Haystonne, Bart.; was born on the 27th December, 1836.

Educated at the Universities of Basle and Edinburgh (LL.D. Edin., 1884), the Lord Justice-Clerk entered the bar of Scotland as an advocate in 1859, and was made Q.C. in 1880. He held the offices of Sheriff of Ross, Cromarty, and Sutherland, 1874-76; Solicitor-General for Scotland, 1876-80; and Sheriff of Perthshire, 1880-5. Was one of H.M. Commissioners of Northern Lights 1876-80 and 1885-8; member of H.M. Prison Board for Scotland and H.M. Board of Supervision, 1880-85. Was Dean of the Faculty of Advocates 1882-5, and Lord Advocate of Scotland 1885-8; sworn of H.M. Most Honourable Privy Council 1885; one of the Committee of Council on Education in Scotland, 1885-8; Companion of the Bath. 1886; Volunteer decoration, 1892; Chairman of Royal Commission on Boundaries of Glasgow, 1887; Lord Justice-Clerk of Scotland and Lord President of the Second Division, Court of Session, 1888. He is a J.P. and D.L. for the county of the City of Edinburgh, and a Member of H.M. Board of Manufacturers for Scotland. He was Colonel-Commandant of the Queen's Rifle Volunteer Brigade, 1882-1892; Brigadier-General of the Forth Brigade since 1888; F.R.S E., 1886, and Associate (1882) and Member (1886) of the Institution of Electrical Engineers; F.R.S., 1888. Is a Brigadier-General of the Royal Company of Archers (Queen's Body Guard for Scotland). Unsuccessfully contested Edinburgh 1874 and 1880, and Haddington Burghs 1878; and sat as M.P. for Edinburgh and St. Andrews' Universities 1885-8. Married, 1864, Adelaide Jeanette (died 1870), daughter of Major Doran, of Ely House, Wexford, and has issue. Residences: 15, Abercromby-place, Edinburgh; New and Royal Societies Club, Edinburgh; and Constitutional Clubs, London. Inventor of a portable field telegraph for the use of armies in the field (silver medal, International Exhibition, Edinburgh) and a holophote course indicator for the prevention of collisions at sea (silver medal, Edinburgh Exhibition; bronze medals, International Invention Exhibition, and Crystal Palace Electrical Exhibition; diploma of honour, Exhibition of Means and Appliances for Preservation of Life, Alexandra Palace, 1882). He has also received decorations and awards from His Majesty the King of the Belgians and the United States President and Congress.

McGREGOR, Wm., Member of the Institute of Electrical Engineers, Managing Director of the Polytechnic, Bournemouth, &c., and late Chief Superintendent Government of India Telegraphs, Assam.

Mr. McGregor was born in 1838; he is the eldest son of the late William Lewis McGregor, M.D., a senior surgeon of the Bengal Army. He was prepared for the Euphrates Valley or Indian Junction Telegraphs, but on the outbreak of the Indian Mutiny was trained at Gresham House under Sir W. B. O'Shaughnessy, Knt., founder and first Director-General of the department for service in the Indian Telegraphs, which he joined under covenant with the Honourable East India Company in August, 1857, arriving at Calcutta in November, when the Mutiny was at its height. Six months later he was placed in charge of the Presidency office, having previously ranked as second at this very trying period. After holding charge of such important offices as Calcutta, Benares, Agra, Delhi, and Simla, he was promoted to Assistant-Superintendent (one of the original ten) and posted to the Dacca Circle, where he was placed in special charge of the construction of the first land line connecting India with Burmah, and where the attacks of jungle fever nearly proved fatal. Notwithstanding this, he was able to render valuable service during the cyclone of 1864, when the lines for a radius of 80 miles around Calcutta were totally wrecked, and all telegraphic communication entirely cut off. Afterwards he was transferred to the Scinde Division, Kurrachee, where he not only discovered and removed the fault causing unsatisfactory communication on the main line to Bombay on the eve of the opening of the line to Europe, but later on rendered valuable service during the floods of 1866, when many lines were washed away. He was favourably mentioned and noticed in the *Gazette of India*. Serious illness caused by this exposure and previous exposure when doubling the Kurrachee line during the worst season of the year, compelled him to take sick furlough to England in March, 1867. In London he attended the lectures by Prof. Tyndall, at the School of Mines, and before returning to India published his "Questions on Magnetism, Electricity and Practical Telegraphy." He also while on this sick leave took out a provisional patent for a telescopic iron mast

Digitized by Google

for telegraph spans across Indian rivers, but from various causes was unable to complete the patent. A very similar support is, however, now in use in India under the title of the A B C D E combination. Having, while at Simla, passed the old Higher or P.H. Standard Examination in Hindustanee, he was asked by the India Office to undertake the examination in London of candidates taking up that language, in 1867-8. On his return to India he was appointed Superintendent of the Indore Division, a post he held for five years; here he successfully introduced the experiment of working combined telegraph and post offices, and the training of soldiers in telegraphy, working several of his offices by them. His exertions both in respect to these experiments and the work of the division were most favourably commended and noticed by the Agent to the Governor-General for Central India. In 1874 he again took furlough to England, devoting his leisure to study and the subject of lightning accidents, and before returning to India published his pamphlet "On the Protection of Life and Property from Lightning," on which the Director-General of Telegraphs in India was requested to inform Mr. McGregor that his attention to this subject was viewed with satisfaction by the Government of India. From the date of his second return to India in 1875 to September, 1884, and subsequent retirement from the Indian Service, Mr. McGregor held administrative charge for a few months of the Arakan Division, and for over nine years of the Assam Division, during which period the telegraph was considerably extended, from Gauhati to Dibrughur and Sudya; from Dhubri, up the north bank of the Brahmaputra River, to the site of a new cable, which was successfully laid while the old one was considerably lengthened after removal of faults. During the Naga Hill disturbances the wire was carried into that country, connecting the stronghold of Kohima with the civilised world. Mr. McGregor was in charge of the arrangements in connection with the field telegraph and post offices during the military operations which resulted in the recapture of the stockade at Kohima, in addition to his own duties, services for which he was favourably mentioned and thanked by the Assam Government and the Director-General of Telegraphs. While in the Indian Telegraph service he suggested, among other ideas, the use of stamps, a simple lightning protector for instrument relays, and, before a proper check and electrical standard were adopted, means for reducing the very great waste of battery material, &c. Since retirement from the Indian Telegraph service Mr. McGregor has been most anxious for employment, and has energetically, so far as means and health permitted, pushed to public notice the subject of lightning protection, and has published another pamphlet, "On the Loss of Life and Property by Lightning at Home and Abroad," as a plea for the formation of a society for the protection of life and property from lightning, of which his old chief, Sir W. O'S Brooke, Kt., consented to become patron. At the British Association Meeting held at Birmingham in 1886 he read a Paper on this important subject, and but for ill health, caused by length of service and extraordinary exposure in some of the worst parts of India, it was his intention to have again brought forward the subject at the Manchester, Bath, and Newcastle-on-Tyne Meetings in 1887, 1888, and 1889. Since removal to Bournemouth Mr. McGregor has been elaborating a seaside Polytechnic scheme for that rising town, with classes, private and popular, for the study of arts, sciences, languages, and industries; the Athenæum Home Club for those engaged in teaching. The Central Public Subscription and Penny Reading Rooms, conducted by him, are making progress, and becoming useful institutions, with special reference both to technical and scientific instruction.

MAIER, Julius, Ph.D. Born in Stuttgart, Germany; educated at the Gymnasium and Polytechnic School of Stuttgart and the Universities of Göttingen and Greifswald.

Mr. Maier came to England in 1866, and was science master in Cheltenham College from 1872 to 1883. He is the author of "Aetherische Oele" (essential oils), published by Neff, of Stuttgart; "Hospitalier's Modern Applications of Electricity," "Arc and Glow Lamps," "The Telephone and its Practical Applications" (in conjunction with Mr. W. H. Preece).

MANCE, Sir Henry Christopher, C.I.E. Born in Exeter, 1840.

Sir Henry Mance was educated at private schools in Bath. In 1858 he entered the service of the Electric and International Telegraph Company, served four years in the London district (partly at the India Office), and in 1863 was appointed to the Persian Gulf Telegraph Expedition, organised for the Secretary of State for India by the late Colonel Patrick Stewart, R.E., with the object of effecting telegraphic communication between England and India. During the manufacture of the cable at the gutta-percha works, Wharf-road, Sir Henry, or, rather, Mr. Mance, as he then was, was placed at the disposal of Messrs. Bright and Clark, the Government engineers, and while serving under the late Mr. C. E. Laws, their chief electrician, acquired the experience qualifying him for the appointment of assistant-superintendent, in which capacity he joined the Mussendum Station, in Arabia, at the entrance of the Persian Gulf, after accompanying Colonel Stewart overland to Bombay, and serving with the expedition during the submersion of the Gwadur-Mussendum section. He was promoted to the grade of superintendent in 1866, and served for some years in that capacity in Mesopotamia, Persia, Arabia, Beloochistan, and India. In 1869 he invented the heliograph, and having designed an efficient form of sun-signalling apparatus, for many years energetically advocated its use in the British Army. The value of the system, which is now adopted in nearly every military service in the world, was fully demonstrated during the Afghan Campaign of 1878-9, and also during the war in Egypt. For his services in connec-

Digitized by Google

tion with this invention he was, in 1883, created Companion of the Indian Empire. In 1872, under instructions from the Secretary of State for India, he visited the cable station at Valentia for the purpose of reporting to Government on the system of working. During his service in the Government Persian Gulf Telegraph Department he acted for one year as traffic manager and in 1873 was appointed (at first officiating) engineer and electrician of the cable. On the occasion of his first repairing expedition (July, 1873) the body of an enormous whale was raised to the surface entangled in the fractured cable. While serving as engineer he superintended the erection at Karachi of a factory equipped with the necessary machinery for the manufacture of telegraph cable. His method of taking the internal resistance of batteries, now known as "Mance's method," was communicated by Sir William Thomson to the Royal Society in 1871. He is the author of certain Papers published in the *Proceedings* of the Society of Telegraph-Engineers on "Duplex Telegraphy," "The Durability of Guttapercha and Indiarubber Joints," "The Relative Susceptibility of Indiarubber and Guttapercha to Attacks from the Teredo"; and he was the first to communicate a description of the remarkable light circles phenomenon seen at rare intervals on the surface of the sea in the vicinity of the Persian Gulf, the cause of which has never been satisfactorily explained. On the introduction of the Brown-Allan relay, in connection with the Persian Gulf cable, he designed especially for these instruments an automatic system of double-current translation. The difficulties caused by the unstable character of this sensitive relay were entirely obviated by means of this system, which is still working successfully, while at the same time considerable economy in working has been effected. In 1884 he published in the *Journal* of the Society of Telegraph-Engineers and Electricians his method of eliminating, by means of a simple formula, the effects of polarisation and earth-currents while testing partial earth-faults in cables. By the application of this correction errors in testing are reduced to a minimum. For this Paper he was awarded by the Society the Paris Exhibition Premium for that year. In 1885 he received the honour of knighthood, and was deputed by Government to assist the late Sir John Bateman Champain, Director-in-Chief of the Government Indo-European Telegraph, in organising and fitting out the expedition, consisting of the cable ships "Dacia" and "International," for the purpose of duplicating over 500 knots of the Persian Gulf cables. He is the author of the book giving an official report of this work, after the completion of which he retired from the Government service. Sir Henry was Captain in the Sind Volunteers for some years, and appointed by Government Scientific Referee to the port of Karachi. Sir Henry is a member of the Physical Society and of the Institute of Civil Engineers, a vice-president of the Institution of Electrical Engineers, was president of the Wednesbury Institute for 1890-91, is chairman of the Oxford Electric Light Company, the Bedford Electric Light Company, and a director of the West African Telegraph Company and of the Electric Construction Company.

MARKS, Louis B., B.S., M.M.E., Member Am. I.E.E. Born New York City, January 25, 1869; educated at College, City of New York, and Cornell University.

Began study of electricity in 1882, and entered New York College 1883. Most of his time at college was devoted to the study of chemistry and physics, and he made a specialty of light in experimental work in his private laboratory. He graduated Bachelor of Science at College, City of New York, in 1888, entered senior year at Cornell University the same year, and was graduated in the Electrical Engineering course with M.E. degree in 1889, and with M.M.E. degree in 1890. He represented the Cornell University at Boston in 1890 at the general meeting of the American Institute of Electrical Engineers, and presented a Paper on "Life and Efficiency of Arc-Light Carbons." The results published in this Paper were based on original investigations by the author in the physical laboratory of Cornell University, the investigations having been carried on under the direction of Prof. Nichols. While at Cornell he made a specialty of the arc light, but he also made researches in widely different branches of physics. Mr. Marks devised the "spiral-coil" voltameter, the merits of which have been discussed in a Paper presented before the American Institute of Electrical Engineers by Prof. Harris J. Ryan. He has made experimental researches on converters, especially effects of heating the cores, the results of which have been published in the *Transactions*. He entered the service of the Washington Carbon Company, of Washington, Pa., in 1890, as expert, and continued with them for three years, during which time he devised several new forms of electrodes and took out several patents, among them the American moulded cored carbon patent. In 1893 he became affiliated with the Royal Arc Electric Company, of U.S.A., and is the chief electrician of the Company. He has lately made extensive researches on a new form of arc light, the invention of Mr. Louis E. Howard. He read a Paper on "A New Incandescent Arc Light" before the International Electrical Congress, at Chicago, in August, 1893.

MASCART, Eleuthere Elie Nicolas, was born at Quarouble (Nord), France, on February 20, 1837. He studied at the College of Valenciennes, and graduating there, became tutor at the Lycées of Lille and Douai, at the age of 19. In 1858, in order to complete his studies, he entered the École Normale Supérieure, and, after completing the course, remained until 1864, as préparatour, or assistant professor.

In 1865 M. Mascart was called to the Chair of Physics in the Lycée at Metz, and shortly after to the same Chair at Versailles. In 1868 he took the adjunct professorship of physics at the College of France, beside the celebrated Regnault, and on the retirement of the

Digitized by Google

latter he succeeded to the full professorship. During the Franco-Prussian war M. Mascart undertook the sub-directorship of the cartridge and chassepot factory at Bayonne, and at the end of the war was created Chevalier of the Legion of Honour. In 1878 he was appointed Director of the Central Meteorological Bureau of France, a position which he still holds, and in 1884 was elected a member of the French Academy of Sciences. The scientific writings and publications of M. Mascart are quite numerous, and all of eminent value. His first work was published in 1864, and was a memoir entitled "Researches on the Ultra-Violet Solar Spectrum and the Determination of the Wave Lengths of the Luminous and Ultra-Violet Rays." Since then he has given to the world a large number of memoirs, especially on light and electricity. In 1876 M. Mascart published his "Treatise on Static Electricity," in two volumes, and between 1882 and 1886 the well-known work entitled "Lessons in Electricity and Magnetism.' This work, in which M. Joubert collaborated, has been translated into the English and German languages. M. Mascart has lately published a "Treatise on Optics," in three volumes which, like his preceding works, has at once become a standard authority on the subject. M. Mascart is much sought after as a representative in scientific circles. He has been President of the French Physical Society, of the Société Internationale des Electriciens, and of the French Meteorological Society, and he is at present Vice-President of the Consulting Committee on Arts and Manufactures attached to the French Ministry of Commerce. At the Paris Electrical Exhibition and Congress of 1881, M. Mascart was general reporter of the Congress and of the Jury, for which services he was created Officer of the Legion of Honour. In connection with the Paris Exhibition of 1889 M. Mascart was President of the Technical Committee on Electricity, President of the Jury of Class 62 (Electricity), and also President of the International Congress, and he was then created Commander of the Legion of Honour.

MASSEY, W. H. Born Oct. 1, 1848, at La Seyne, near Toulon.

Educated partly in France and Russia, and also at the Grammar School, Leeds, in which town he subsequently served a long apprenticeship with a firm of engineers and millwrights. After being at sea in a Russian steamship, he entered, in 1870, the employ of Messrs. John Penn and Sons, of Greenwich, where he soon took a leading position in outdoor affairs. In 1875 Mr. Massey was engaged by a company of marine engineers in Berlin, and several important contracts in the German Government dockyards were entrusted to him. He returned to England the following year, and after being for some time with Messrs. Hunter and English, of Bow, he was in 1877 appointed outdoor manager for Messrs. John Fowler and Co., the agricultural and mining engineers. During the next four years Mr. Massey's work took him into every part of England and Wales, and he was frequently consulted as to engines and machinery for electric lighting. In October, 1881, he accepted an offer from the Electric Light and Power Generator Company, to be their general manager; but finding himself in disagreement with his directors and the promoters he soon resigned his appointment and started in business on his own account, being retained as consulting engineer to the company. He afterwards acted as advising engineer to the Swan United Company, in getting together the staff of the Edison and Swan Amalgamated Companies; and he has since then established an extensive private consulting practice. Mr. Massey is a member of the Queen's Household, his appointment there being regarded as the first official recognition of electrical engineering. He is a member of the Institution of Electrical Engineers; of the Institution of Civil Engineers; of the Institution of Mechanical Engineers; of the Institute of Marine Engineers; of the Iron and Steel Institute; of the Physical Society; of the South Wales Institute of Engineers; and is a *membre fondateur* of the Société Internationale des Electriciens. He is the author of several Papers on "Compressed Air," and the "Practical Application of Electricity." Mr. Massey served on the Electrical Jury at the Inventions Exhibition in 1885, and also on the Jury for Machinery in General at the Paris Universal Exhibition, 1889, when he was made "Officier de l'Instruction Publique." He was a member of the Council of Advice, and on two juries at the Crystal Palace Electrical Exhibition in 1892; he was on the Committee of Engineering and Architecture for the World's Fair in 1893, and was appointed judge for machinery by the British Commission, but was prevented by illness from going to Chicago.

MAVOR, Alfred E., M.I.E.E., A.M.I.C.E. Born at Glasgow in the year 1865.

Mr. Mavor was educated at the Glasgow Academy, and after spending two years in the drawing office of a civil engineer joined the Edison Company in 1882. Mr. Mavor carried out a large number of installations on board steamships, and devoted much attention to this branch of electrical engineering. With a view to extending his experience he went a voyage round the world in 1883, visiting the Australian Colonies and South America. On his return to England he was appointed electrician to the Chilian Navy, holding a commission as Lieutenant. Mr. Mavor remained on the Pacific Coast for two and a-half years, and developed many naval electrical appliances on board the war ships and torpedo boats of the fleet. On the termination of his engagement with the Chilian Government. Mr. Mavor went north to San Francisco as a guest on board the U.S. frigate "Shenandoah," and continued his travels through the United States and Canada. Returning to England at the end of 1886 he was commissioned to rearrange and extend the installations required for lighting the superstructure of the Forth Bridge during its construction; extensive plant was put down under his supervision, and arrangements made to enable the work to be carried on by night almost as rapidly as by day. On the completion of his work there,

Digitized by Google

he was appointed electrician to Messrs. Denny Bros. of Dumbarton; and in May of 1890 he joined the Fowler-Waring Cables Company as General Manager, a position which he now holds.

MAXIM, Hiram Stevens. Born at Sangersville, in Maine, February 5, 1840.

Amongst Mr. Maxim's early inventions may be mentioned the following:—Machines for making illuminating gas, automatic boiler feeds, automatic water-raising appliance, automatic fire alarm and extinguisher, &c., &c. Maxim's electrical career may be said to have commenced in 1877, when he made a writing telegraph, which lent itself admirably to transmitting messages in the Chinese language, the letters in which are too numerous for the Morse code. This invention was, however, destined to be superseded by the telephone, then brought out by Prof. Graham Bell. At that time Maxim expressed to Mr. Schuyler, with whom he had made an arrangement for electric lighting experiments, his opinion that the carbon of lamps does not become fused or volatilised, but simply oxidised by the atmosphere, or by some combination of the oxygen in the lamp. To prove that oxygen is the sole destructive agent, he made a lamp from which he expelled the air, introducing gasoline vapour in its place, when he found that the carbon, instead of wearing away, gained in weight and volume, while assuming a grey metallic colour. He then experimented with platinum for producing light, and invented an incandescent lamp with a filament of that metal, at the same time turning his attention to the divisibility, and also the regulating, of electric currents. In 1878 Maxim brought out his carbon incandescent lamp. He afterwards devised several systems of arc lighting which produced an intense light in the focus of parabolic reflectors, the suspended lamps being fed by a single current; and afterwards a regulator of arc lamps. At this stage Maxim had already obtained more than a hundred patents for inventions, many of which related to the details of electric lamps. Having completed his system of arc lighting, he returned to the carbon incandescent lamp, which he had abandoned after having secured it by patent. He wished to employ phosphoric anhydride or anhydrous phosphoric acid for neutralising the humidity in incandescent lamps, but was unable to procure it in New York, so studied its composition and preparation. In a single day he had constructed the apparatus, and by the evening had obtained two litres of this substance (P_2O_5) in a perfectly pure state. In 1880, on a meeting of watchmakers held in New York coming to the conclusion that there was no remedy for the magnetisation of watches, Mr. Maxim asked to be entrusted with a couple, which he completely demagnetised, having devised a machine for that purpose. To keep down the floods of Mexico, and learning that coal was expensive, he proposed to utilise the waterfalls for driving his dynamos, transmitting the force by electric currents. The jury of the Philadelphia Electrical Exhibition awarded a gold medal to the United States Electric Lighting Company, founded in 1877 by Messrs. Schuyler, Maxim, and Williamson, to whom Maxim made over his electric lighting patents. In 1880, on the capital of this company being considerably increased, works were established which are said to be the most complete in New York, besides other branch works in various parts of America. In 1881, Mr. Maxim received the decoration of the Légion d'Honneur from the French Government for his electrical exhibit at the Exposition in Paris. The most noteworthy invention of Mr. Maxim is his system of automatic firearms, in which the force of the recoil is utilised for performing all the functions necessary for loading and firing the arm. The advent of this new system may be said to mark the beginning of a completely new epoch in the manufacture of military firearms. All the great gunmakers in the world, with only one exception, have already expressed their desire to adopt this system. It is said that Mr. Maxim's patents bring in a yearly revenue of a million dollars, or £200,000.

MAY, Dr. Oscar, was born in 1855 at Liestal, in the canton of Baselland, Switzerland.

After studying at the Frankfort Real Gymnasium and at the Aachen Polytechnicum, he took the degree of Doctor in Natural Sciences at the Freiburg University. Dr. May is one of the founders of the Elektrotechnische Lehr- und Untersuchungs-Anstalt of Frankfort-on-the-Main, and is instructor in electric lighting in that institution. At the Frankfort Exhibition in 1891 he was a member of the Presiding Committee, and one of the secretaries of the Scientific Commission. He is the author of the "Lehrbuch der Kontaktelektricität" (1887), the "Anweisung für den elektrischen Lichtbetrieb" (1887), the "Lehrbuch der Elektrodynamik" (1888), the "Lehrbuch der Elektromagnetismus," Part I. (1888), "Tafel zur Berechnung von elektrischen Leitungen" (1889), "Tafel zur Berechnung von Riemenbreiten" (1890), and "Erläuterungen zu den Vorsichts-Bedingungen für elektrische Licht- und Kraft-Anlagen des Verbande Deutscher Privat-Feuerversicherungs-Gesellschaften" (1893). English and French editions of several of these works have also been published.

MENDENHALL, Thomas Corwin, Ph.D., LL.D. Member of the National Academy of Sciences, &c., &c. Was born on October 4th, 1841, near Hanoverton, Ohio, U.S.A.

He is of Quaker stock, tracing his descent from Benjamin Mendenhall, who emigrated from Wiltshire, England, with William Penn, and settled in Delaware County, Pennsylvania, U.S.A. The earlier form of the family name was Mildenhall, and it is to be found in early English records of the 14th and 15th centuries. His father was one of the pioneers in the settlement of the Mississippi Valley, and as a consequence his early youth was spent under conditions which afforded few opportunities for scholastic training. A fondness for study, and especially for mathematical and physical books

Digitized by Google

was developed at an early age and was a sufficient incentive to induce him to make the best possible use of such facilities for obtaining an education as were available. These were few, however, and he was mostly dependent upon his own efforts. At an early age he became a teacher. On the opening of the Ohio State University in 1873, he was elected to the chair of Physics and Mechanics; and one of the first working physical laboratories for students established in the United States was that organised by him at this time. In 1878 he went to Japan as Professor of Physics in the Imperial University, when he had for colleagues Professors J. A. Ewing, John Milne, and Thomas Gray, and for a brief time Professors Ayrton and Perry, who had been employed in the Engineering College. In the latter part of 1881 he returned to America and resumed his professorship of physics at the Ohio State University. In 1884 he went into Government service at Washington as Professor of Electricity in the United States Signal Service. In 1886 he resigned to accept the presidency of the Rose Polytechnic Institute at Terre Haute, Indiana. After serving in this capacity for three years he was appointed, in the summer of 1889, as Superintendent of the United States Coast and Geodetic Survey, with headquarters at Washington, which position he still occupies (1893). He has received the degree of Ph.D. from the Ohio State University and that of LL.D. from the University of Michigan. He is a member of the National Academy of Sciences, of the American Academy of Arts and Sciences; is past president of the American Association for the Advancement of Science; member of the American Institute of Mining Engineers, and of many other societies. Dr. Mendenhall has been called upon to perform a number of important duties of a semi-diplomatic character, for which his training and experience had fitted him. Among these may be mentioned his service as one of the two United States Commissioners in the Behring Sea Investigation, also his appointment as Commissioner on the part of the United States to mark the boundary line between Maine and New Brunswick and as Commissioner to conduct the joint survey of the boundary line between Alaska and the British Possessions. He was also one of the five delegates representing the United States in the International Electrical Congress held in Chicago, in 1893. Besides being superintendent of the Coast and Geodetic survey he is, by appointment of the President, a member of the Lighthouse Board, and is superintendent of the office of Standard Weights and Measures. He has published numerous contributions to science, in the transactions of scientific societies and in the leading scientific journals. Many of these have related to electricity, and in 1886 he published a historical *résumé* in one volume, entitled "A Century of Electricity," of which an English edition was also issued. During his connection with the United States Signal Service, and for some time after, he carried on systematic experiments relating to atmospheric electricity, the results of which were published in an extensive memoir by the National Academy of Sciences in 1892. He is actively interested in gravity research, having made determinations by the use of the pendulum in Japan and in Alaska and the Pribilof Islands, by improved methods and instruments, largely of his own design.

MILLER, Oscar von. Born in Munich in 1855. Educated at the Polytechnikum.

He commenced his professional career as engineer during the construction of railways, bridges, and waterworks. In 1880 he passed the examination for State Engineer, and was transferred to the Government of Upper Bavaria, and in the following year he was sent to the Paris Electrical Exhibition to report on the development of electricity. On his return to Munich, von Miller superintended the electrical experiments in the Glass Palace, at the first Electrical Exhibition in Germany. It was under his supervision that the historic experiment of transmitting power from Miesbach to Munich was carried out by means of a telegraph wire. In 1883 he was commissioned by his Government to report on the best means of utilising the water power of Bavaria for electrical purposes, and in quest of information he travelled through Italy, France, Holland, Belgium, England and America. Later in the same year he became manager of the newly-founded Edison Company in Berlin (now the Allgemeine Elektrizitätsgesellschaft), and in conjunction with his colleague Herr Rathenau constructed the first and largest central station in Germany. In 1885 he also undertook the management of the Berliner Elektrizitätswerke, and held both positions until 1890, when he returned to Munich. There he founded an office for planning and constructing electrical central stations for the transmission of power, and built those at Cassel (where he utilised a distant waterpower for the production of electricity), Lauffen-Heilbronn (the machines at which place were used for the celebrated Lauffen-Frankfort long-distance power transmission), and Schöngeising-Fürstenfeld Bruck. He has been engaged by many local authorities in planning central stations, as for Frankfort-on-the-Main, Buzen-Meran, Stuttgart, Strasburg, Munich, Wiesbaden, Heidelberg, Nuremberg, Hermanstadt in Siebenbürgen, Kristianstad in Sweden, &c. In 1891 Oscar von Miller was invited to undertake the technical conductorship of the Frankfort International Electrical Exhibition, where he endeavoured to give a stimulus to the electrical transmission of power and to settle the then burning question of alternate currents *versus* direct currents, and his efforts have been acknowledged on several occasions in Bavaria, Prussia and Italy.

MORDEY, William M., M.I.E.E., was born in March, 1856.

When fourteen years of age Mr. Mordey entered the Postal Telegraph Service. After being employed for a short time in London he was removed to Bradford, Yorkshire. Having devoted his leisure to the study of branches of physics related to telegraphy, with a view to obtaining some scientific knowledge of

Digitized by Google

that subject, he was asked to conduct classes formed by his fellow *employés* for the study of electricity and magnetism and telegraphy. These classes, which were in connection respectively with the Science and Art Department and the City and Guilds Technological Institute, were very successful. In telegraphy he had to rely entirely on his own resources, as no tuition was obtainable. Sitting for examination with his own class in 1881 he obtained the second prize and medal of the City and Guilds Institute in the "Advanced Stage" of this subject. At the end of the same year he left the telegraph service, and obtained employment as an electrician with the Anglo-American Brush Electric Light Corporation, now the Brush Electrical Engineering Company, and was at once offered the post of superintendent of the testing department in the works of this corporation in London. He has continued in this service till the present time, being now the Company's chief electrician. Among the earlier advances in everything connected with what has been called "heavy electrical engineering," not the least important was the success of the Brush Corporation's "Victoria" dynamo, a machine which was the result of Mr. Mordey's discovery and investigation of some interesting abnormal features in a less perfect form of generator. In 1883 he described, before the Society of Telegraph-Engineers, some experiments showing that the resistance of masses of finely-divided metals really follows the same law as carbon—viz., that such resistance diminishes with the rise of temperature, an action that had previously been supposed to form a dividing line between carbon and metals. For a Paper by him on "Some Prejudicial Actions in Dynamo Machines," read in 1884, he received the honourable mention of the Council of the above-mentioned society. In the same year he described, before the Institution of Civil Engineers, the methods and constructions that are best adapted for working compound dynamos of similar, as well as unlike, size, powers, or speed, in parallel circuit. To the *Philosophical Magazine* for January, 1886, he contributed a Paper on "The Dynamo as a Generator and as a Motor: Some Analogies and Contrasts," in which some experiments and observations, made by himself and Mr. C. Watson, were described that threw something more than doubt upon many of the views that had generally been held with regard to electric motors. The conclusions arrived at in this article have passed into general practice, although at the time they were diametrically opposed to the teaching of well-known authorities on the subject. At the British Association Meeting of 1886 he read a Paper and showed some experiments on "An Electric-Motor Phenomenon," illustrating very forcibly some effects of self-induction; and in the same year, before the South Wales Institute of Engineers, he read a Paper dealing with the subject of the possibility of explosions in fiery mines with incandescence electric lamps. In 1887 he was engaged at the Victoria Works of the Brush Company on his "Alternator," an alternating-current dynamo of a new type, which, together with his transformer and other apparatus, have been successfully introduced by the Company under the title of the "Mordey-Victoria Alternate-Current System." This system is now being used for general lighting in about sixty towns abroad and at home—amongst other important places, for the lighting of the Central and Western districts of the City of London. Mr. Mordey was in 1888 elected an Associate Member of Council, and from 1890 to 1893 he was a Member of Council of the Institution of Electrical Engineers, before which Institution in 1889 he read an important Paper on "Alternate-Current Working," dealing with many branches of the subject, and especially with the principles underlying the best construction of alternators for the purpose of parallel working and for synchronising motors. For this Paper he received the "Institution Premium" of the year. In 1893 he contributed two Papers on branches of the same subject to the same Institution. In 1891 he visited the United States, mainly to examine the systems of electric traction in use in that country. He is a Member of the Physical Society and of the American Institute of Electrical Engineers. He was on the Electricity Committee of the Royal Commission for the Chicago Exhibition of 1893, and on the Honorary Council of Advice of the Crystal Palace Electrical Exhibition. He is an occasional contributor to the columns of *The Electrician* and other scientific journals.

MOULTON, John Fletcher, Q.C., M.A. (Lond. and Cantab.), F.R.S. Born at Madeley, November 18, 1844.

Mr. Moulton is the son of the Rev. James Egan Moulton. He received his education first at the New Kingswood School, near Bath, where he gave the promise of his later achievements by securing the first place (Senior All-England) in the Oxford examination. From the Kingswood School he proceeded to St. John's College, Cambridge, and here passed through a very distinguished academic career. His predilection was for mathematics, and his success in this department procured for him a series of scholarships and prizes, including the University Scholarship and Gold Medal of the London University, and culminating in the First Smith's Prize and Senior Wranglership. In this last examination Mr. Moulton's pre-eminence was so pronounced that his score of marks so far exceeded those of the Second Wrangler that the excess above what would have been necessary to secure the first position would alone have sufficed to give him high rank in the Honours' List. Upon leaving college Mr. Moulton at first gave his attention to tutorial functions, for which his remarkable college career seemed to designate him. Eventually, however, the attractions of a larger sphere prevailed, and in 1873 he resigned his professorship at Cambridge and migrated to London, where, in the course of the following year, he received his call to the Bar. In the course of his legal career Mr. Moulton has been concerned in a large number of causes in which scientific and technical questions have arisen. In particular, he

Digitized by Google

has had a large experience of actions arising upon patents for the various applications of electricity, which is a subject that he has largely made his own. In the years 1879 and 1880 he wrote, in collaboration with the late Dr. William Spottiswoode, at that time President of the Royal Society, two elaborate monographs on the "Electrical Discharge in Vacuum Tubes," or, to give the Papers their authentic title, on the "Sensitive State of Electrical Discharges through Rarefied Gases." These Papers, dealing as they did in an exhaustive manner with the beautiful but little understood phenomena of the manifestations of electricity in very highly attenuated gases, attracted much attention at the time of their publication, and Mr. Moulton was shortly afterwards elected to the Fellowship of the Royal Society. In the following year, 1881, Mr. Moulton assisted at the Congress of Electricians which was held at Paris in connection with the Electrical Exhibition of that year. The Congress, as is well known, addressed itself to the discussion of several questions of capital importance, and, among other things, it succeeded in fixing an international unit of electrical resistance. In these deliberations Mr. Moulton took an active part, and for his services on this occasion to the cause of science he received from the Government of the Republic the decoration of the Legion of Honour. Mr. Moulton has sat in Parliament, having represented Clapham in the Parliament of 1885-86.

MOUNTAIN, William Charles.

Completed his education in 1876 at Sutton Court, Chiswick, London, and was then apprenticed to his father's firm, Messrs. May and Mountain, general engineers and ironfounders, Suffolk Works, Birmingham. After serving about three years of his apprenticeship, Mr. May died, and Mr. Mountain then had to assist his father in the management of the business. In 1880 the firm of May and Mountain was dissolved, and re-established under the style of Mountain and Sons, and until 1883 Mr. W. C. Mountain acted as manager of the business under his father. In this year he was offered the position of engineer to the Gülcher Electric Light Company, which he accepted, and after being with the Company a short time, was appointed General Manager, and had a seat on the Board of Directors. He remained with the Gülcher Company for five years, during which time the business of the Company largely developed, and many improvements in the design of the dynamos and electrical machinery were introduced. At the end of 1888, he resigned his position as manager of the Gülcher Company, and joined Mr. Ernest Scott, of the firm of Ernest Scott and Co., Close Works, Newcastle-on-Tyne, and in August of that year the firm commenced the electrical branch of their business, which is under the control of Mr. Mountain, who introduced their now well-known Tyne dynamo, arc lamp, and transformer; and so successful has this branch of their business been that the firm turned out upwards of 400 dynamos, besides a large number of arc lamps, in less than three years. In November, 1890, the firm was transformed into a limited company under the style of Ernest Scott and Mountain, Limited, who are now carrying on the old business of Ernest Scott and Co. The works have been more than trebled in size; and the firm are now manufacturing combined engines and dynamos.

MUNRO, John. Entered telegraph work in connection with the Great Western Company.

Mr. Munro is the author of "Electricity and its Uses," "Pioneers of Electricity," "Heroes of the Telegraph," "Romance of Electricity," "The Wire and the Wave: a Tale of the Submarine Telegraph," &c.; and he is joint author of Munro and Jamieson's "Pocket-book of Electrical Rules and Tables."

MUNRO, John M. M., M.I.E.E.

After serving an apprenticeship at mechanical engineering, and after a course of scientific study under private teachers and at the Andersonian College, Glasgow, and other technical schools, Mr. Munro joined the firm of Anderson and Munro, of Glasgow (established by his father in 1840). The electrical department of the business was at that time of minor importance, but when the first rumour of the telephone came over from America the firm began to make and erect these instruments, and in March, 1880, issued circulars relative to the establishment of telephonic exchanges in Glasgow. In 1878 Mr. Munro produced and described in various home and foreign scientific journals a form of glow-lamp in which thin pencils of carbon were coated with infusible earths—the idea being that they could be constructed so cheaply that their short life was of no moment. These lamps were worked on a series transformer system, as described in the *English Mechanic*, January 3, 1879. In September, 1881, Anderson and Munro's workshops were lit throughout with Swan lamps, superseding arc lighting by the old A Gramme machines, and within a few months afterwards the firm were engaged in fitting these lamps into factories, &c., throughout Scotland. Thus early and energetically in the field, Anderson and Munro have all along maintained a leading position as electrical engineers, and have designed and erected a large number of electric light installations at home and abroad. They were the engineers and constructors of the very successful Carstairs Electric Railway, and are associated with Sir William Thomson and Dr. Bottomley as electrical advisers to the Kelvinside Electricity Company, Limited. They are also engineers to the Norway Power Transmission Syndicate, and other companies and public bodies. Mr. Munro is patentee of a number of inventions, one of the best known of which is a fire-alarm system, which has been very successful in Glasgow and neighbouring burghs. He also holds important patents relative to electric railways and tramways, and to distribution from supply stations. Mr. Munro has for many years made a special study of town lighting. The

Digitized by Google

Munro Electrical Manufacturing Company, Limited, was formed as an independent concern, and now possesses a well-equipped factory to make for the trade these various inventions and electric material generally, Anderson and Munro giving their whole attention to electrical engineering and contracting. Mr. Munro is the author of a little manual on the management of electrical accumulators, and numerous magazine articles, and also a book, "Spiritual Dynamics," dealing with some of the burning questions which lie on the borderland between science and religion.

NEALE, John, M.I.E.E. Born in London in 1833; educated at Trinity School, Bow, under the Rev. H. Barnacle.

Mr. Neale joined the services of the Electric and International Telegraph Company in 1851, at the Strand Office; at Stafford, 1852; at Manchester, 1853; and Birmingham, 1854. In 1859 he was appointed inspector in charge of the North Staffordshire and London and North-Western lines in the midland counties. In 1870, on the transfer of the telegraphs to the Government, he was appointed telegraph superintendent and engineer to the North Staffordshire Railway Company, which position he now holds. In 1855 Mr. Neale proposed and submitted to the Electric and International Telegraph Company, a system of using vertical instead of horizontal dots and dashes, in order that the working of the ordinary single needle instruments could be recorded on the Morse printers, and the two systems assimilated. The suggestion was not adopted. In 1873 he patented the acoustic S.N. dial, which is now used by the Post Office and railways; and a single wire block instrument which is in use on the North Staffordshire Railway; also a recording block instrument for permissive block use, showing the number of trains actually in the section; and a rail brake, so that trains can announce their approach at level crossings automatically. Mr. Neale also acts as honorary secretary to the Railway Telegraph Superintendents and Engineers at their half-yearly meetings.

NICHOLS, Edward Leamington, M.A., Ph.D. (Goettingen). Born in 1854. Educated at Cornell University, Ithaca, New York, the Universities of Leipzig, Berlin, and Goettingen, and at the Johns Hopkins University, Baltimore.

Mr. Nichols graduated with the degree of Bachelor of Science at Cornell University in 1875. A taste for the study of physics, acquired while an undergraduate of that institution, led him to Germany, where he came under the instruction of Prof. Wiedemann, father and son, in Leipzig (1875-76), and Von Helmholtz in Berlin (1876-78). The two years which he spent in the Physical Laboratory of the University of Berlin were devoted chiefly to research, at first as a co-worker with the late Prof. J. J. Mackenzie, of Halifax, in an investigation on the influence of absorbed gases on the volume of liquids (*Annalen der Physik und Chemie*, N.F. 3, p. 134), subsequently on the radiation from glowing platinum. The latter work formed the subject of a thesis, presented upon receiving the degree of Ph.D., in Goettingen, in 1879. Early in that year Mr. Nichols returned to America. He continued his study of physics in the laboratory of Prof. H. A. Rowland, of the Johns Hopkins University, of which institution he had been elected Fellow. In 1880 he joined the forces of Mr. Edison, whose system of incandescent lighting was undergoing the final tests, at Menlo Park, New Jersey, preparatory to its practical introduction into New York. In 1881 Mr. Nichols began his career as a teacher, as Professor of Physics and Chemistry in a small Kentucky college (Central University). In 1883 he was appointed to the Professorship in Physics and Astronomy at the University of Kansas, where he organised courses in electrical engineering, and was instrumental in securing from the State Legislature the first appropriations of money for the purposes of instruction in that subject. In 1887 he was made Professor of Physics in Cornell University, which position he still holds. Mr. Nichols is the author of more than fifty Papers on experimental physics, which have appeared in the leading scientific and technical journals, and in the *Transactions* of various societies. He is a Fellow of the American Association for the Advancement of Science, Past-President of the Kansas Academy of Science, and a member of the American Institute of Electrical Engineers.

OBACH, Eugene, Ph.D., F.I.C., F.C.S., M.I.E.E., &c. Born April 26, 1852, in Stuttgart, South Germany.

Dr. Obach studied mathematics and natural sciences for five years at the Polytechnic School of Stuttgart, under Profs. Gugler, Baur, Zech, Fehling, and Victor Meyer. Acted temporarily as lecturer on chemistry at the Veterinary School of the same town. Completed his studies at the University of Leipzig, under Profs. Kolbe, Wiedemann, Zöllner, Fechner, and C. Neumann, and graduated there as Ph.D. in 1875. He entered the firm of Siemens and Halske of Berlin as assistant to Dr. Werner Siemens in the spring of the same year. Dr. Obach came to England towards the end of 1876, and joined Messrs. Siemens Brothers' staff at Woolwich as chief of the experimental department. Acted as electrician at Ballingskellig Bay, Ireland, during the completion of the Direct United States Cable, and was on board the ss. "Faraday" during the laying of the deep-sea portion of the second French Atlantic Cable. He published his first Paper in 1875, on the action of the galvanic current on amalgams and alloys, and on the nature of amalgamation currents. This subject has recently been prominently brought before the public by the Electrolysis Committee of the British Association, Prof. Roberts Austen's and Dr. Gladstone's experiments entirely confirming Dr. Obach's early results. Dr. Obach is, perhaps, best known by his movable coil tangent galvanometer, which is equally suitable as an ampere- and a volt-meter. The theory of this instrument was first given in *Nature*, in 1878, and a few

Digitized by Google

years later a Paper was read before the Physical Society, describing several important alterations of the original form. Dr. Obach's complete tables for readily finding the ratio of the two sections of the slide wire of a Wheatstone bridge are also much used, particularly in Continental laboratories. Other publications deal with the following subjects:—A battery for constant currents of long duration, a lecture apparatus for the demonstration of electric resistance in metallic wires, an electric pressure regulator, a commutator for liquid and gaseous currents, the diffusion of carbonic acid gas through caoutchouc, the action of manganese peroxide in batteries, a direct relationship between specific inductive capacity and latent heat of vaporisation, the action of phosphorescent light on selenium, the detection of free sulphur and selenium in carbon disulphide and their approximate quantitative determination, and the behaviour of carbon disulphide towards potassium permanganate. In the last-named publication a method for the complete purification of commercial carbon disulphide is given, which may also be of interest to electricians.

In February, 1884, Dr. Obach delivered a lecture on the late Sir William Siemens as an inventor and discoverer, at the German Athenæum, London. This lecture, which was illustrated with diagrams and some of the original pieces of apparatus of the inventor, was afterwards published, and very favourably reviewed by the press.

OFFOR, George. Born in London in 1827.

In 1878 Mr. Offor turned his attention to electric lighting, having in that year undertaken the English agency for the sale of Schückert's dynamo machines; and in the following year became an agent for the Anglo-American Electric Light Company, Limited, which subsequently developed into the present "Brush" Company. Among the installations undertaken by Mr. Offor was the lighting of the Castle Museum, at Nottingham; the Hall-by-the-Sea, at Margate, &c.; and through his agency the concession from the Brush Corporation to the Great Western "Brush" Electric Light and Power Company, Limited, was negotiated during the autumn of 1881 and spring of 1882; this being among the first of numerous subsidiary "Brush" companies since formed. Upon the incorporation of the South-Eastern and Provincial "Brush" Companies, in May, 1882, Mr. Offor was appointed their general manager; and in March, 1883, when the Consolidated Electric Company was formed, for the purpose of manufacturing the storage batteries and other apparatus of the B.T.K. system, Mr. Offor undertook the management of that company, also the house-to-house lighting of Colchester, on the storage system of distribution now so successfully employed by the Chelsea Electricity Supply Company, Limited. The arc lighting of the Great Eastern Railway Company's packet station at Parkeston near Harwich, and the extensive installation for Alfred Rothschild, Esq., at Halton House, were important works of Mr. Offor's company; besides numerous installations of a smaller character. Mr. Offor was one of Lord Thurlow's Committee for obtaining an amendment of the Electric Lighting Act, 1882. He is managing Director of the Crystal Palace District Electric Supply Company, which is working the Provisional Order for the supply of electricity to the Crystal Palace and district. A generating station has been erected at Springfield, Upper Sydenham, with plant for 30,000 lamps, and the Company supplied about 400 horse-power of electrical energy for the Exhibition at the Crystal Palace in 1892. Mr. Offor was for a time general manager and secretary of the Oxford Electric Company, Limited. The system adopted by both companies is that of a continuous current at a moderate high pressure, converted at subsidiary stations into low pressure by continuous-current motor-dynamos and storage batteries, with automatic apparatus for regulating the pressure throughout a network of mains.

OSTWALD, William Frederick. Born at Riga, Livland, September 2, 1853.

After being educated at the Riga Real-Gymnasium, he went, in 1872, to the Dorpat University for his scientific studies, where he remained three years. From 1875-1878 he was an assistant at the physical and chemical laboratory of this University. In 1878 he became instructor at the above University, besides teaching physics, chemistry, and mathematics at the "Realschule" in Dorpat. He accepted the professorship for chemistry at the Baltic Polytechnicum (high school for technical science) in Riga, where he worked successfully for six years, and was appointed professor for chemistry and principal of the Physical Chemical Laboratory at Leipzig in 1887. Prof. Ostwald's scientific researches relate chiefly to the problems of chemical affinity. He instituted thorough researches on the relations existing in electrolytical solutions between capacity of chemical reaction and the corresponding electric conductivity, first mentioned by Arrhenius. On account of the various questions raised by Prof. Arrhenius's theory of electrolytic dissociation he brought out several experiments and observations favourable to this theory. Moreover, Prof. Ostwald based the first method on the experiments of von Helmholtz to measure the true differences of potential between metals and electrolytes. In 1887 he published his "Lehrbuch der Allgemeinen Chemie," in two volumes, and in 1889 a treatise on general chemistry, which has been translated into English. Since 1887 he has published, with Mr. Van't Hoff, the *Zeitschrift für Physikalische Chemie*, which Paper contains the fundamental treatise on the modern views of the electrical theory of chemical affinity. Prof. Ostwald is a member of the Saxonian Society of Science at Leipsig, and a corresponding member of the Bataafsch Genootschap Rotterdam, besides an honorary member of the Genootschap ter Bevordering der Natur-, Genees-, en Heelkund (the Amsterdam society for the progress of natural science, medicine, and chirurgery).

PACINOTTI, Antonio. Born at Pisa in 1841. Signor Pacinotti's researches have extended in several directions. He has studied the behaviour of thermo-electric currents between metals and liquids; he has made some observations on photo-chemical currents, also those produced by the friction of metals which were united in pairs, and then rubbed on cakes of resin or pitch. The streaks where the metals had rubbed were found, by strewing them with Lichtenberg's powders, to be positively and negatively electrified. He is, however, best known for his work on magneto-electric machines. In 1860 he constructed a machine with a "transversal magnet"—in other words, a toothed-ring closed-circuit armature. This machine he described in *Nuovo Cimento*, in 1865, as a motor, observing also that it could be used as a generator of currents. In 1878 he devised a disc armature, identical in design with that used in Hookham's meter, and closely resembling that used in the modern disc dynamos of Desroziers and of Fritsche. His appearance at the Electrical Congress at Paris in 1881 was hailed with great enthusiasm.

PAGE, Samuel Flood. Born in the Isle of Man in 1833. Educated at Christ Hospital and at Rossall College, Lancashire.

A cadet of 1854, he was gazetted ensign in the 2nd Madras European Light Infantry in 1855, Captain and Adjutant Queen's Own Edinburgh Rifle Brigade, 1860, transferred as Captain and Adjutant to the London Scottish R.V. in 1861. Was the first executive officer of the National Rifle Association; organised the shooting arrangements at Wimbledon and held the responsible charge thereof from 1861 to 1865, and was elected to a seat on the council. He originated examinations for volunteer officers, which were afterwards adopted by the War Office. He was the first to organise special lectures, &c., for volunteer officers at the Royal United Service Institution, and was the first adjutant of volunteers who lectured on military subjects to the officers, non-commissioned officers and men of his corps. In 1873, on his election as Secretary of the Crystal Palace, he retired from the service with the rank of major. In 1877 he was appointed manager of the Crystal Palace, and in 1881-82, acting on the suggestion of Mr. Applegarth, C.E., he organised and carried to a most successful issue the first Electrical Exhibition held in the United Kingdom. He was a member of the Executive Committee of the Fisheries Exhibition for which he drafted the rules and regulations, which were followed in the succeeding South Kensington exhibitions. He was a Commissioner for New South Wales at the Fisheries Exhibition. In 1882 on being appointed general manager of Edison's Indian and Colonial Electric Company, he resigned the managership of the Crystal Palace, the shareholders, on the recommendation of the Directors, giving him a grant of a handsome sum of money. He then went to Australia, and introduced incandescent electric lighting into Victoria, New South Wales, Queensland and New Zealand; the Parliament Houses of those Colonies and of the Cape of Good Hope, and many other public and private buildings were lighted by Edison's Indian and Colonial Company and their agents. Shortly after his return from Australia he was appointed Chairman of the Company in succession to the Marquis of Tweeddale. On the foundation, in 1883, of the Edison and Swan United Electric Company he was offered and accepted the office of Secretary and Manager, and in 1885 the post of Secretary of the Swan United Electric Company was added to his duties; he retained both these offices until 1892. He took an active share in the patent litigation in England and on the Continent, and in the negotiations which resulted in the formation of the Compagnie Générale des Lampes in Paris; and in the fulfilment of the duties of his offices he visited more or less frequently France, Germany, Italy, Austria, Russia, Belgium, Switzerland and Holland. Major Flood Page is now a Director of the Swan Company, of the "Compagnie Générale," of the Manchester Edison-Swan, and is Deputy Chairman of the Edison and Swan Company. He is a member of the Royal Institution, of the Institution of Electrical Engineers, Fellow of the Royal Colonial Institution, and of the Society of Arts.

PARKER, Thomas, F.R.S.E., M.I.C.E., M.I.E.E., M.I.M.E. Born on December 22, 1843, at Ironbridge.

His father, and generations of the family previously, had been employed by the Coalbrookdale Company in their foundry, and at 9½ years of age he had to share the same fate, his schooling up to this age having only been such as was obtained in the school at Coalbrookdale, provided by the Company for the workmen's children. It may be remarked that, at this early age, he had climbed nearly through the arithmetic (decimal fractions and mensuration), records of this having been left in his school books. Mr. Parker in his early life manifested great aptitude for mechanics, and great perseverance, having, as early as 14 years of age, built a model steam-engine, and a violin at 16. Good opportunities existed at Coalbrookdale for after-study in the evening, as the Company provided at this time a library for their workmen, and lectures of the highest class, at which he was a careful attendant. At 19 years, by which time he had signalised himself in his business, he left, and took up his abode in Birmingham. Opportunities of evening study here became greater, and he availed himself of the use of the Midland Institute and other educational means, continuing to signalise himself in his business. In 1867, at the age of 23, his abode became Manchester, where the Free Library and the science lectures at the Hulme Town Hall were his source of education. He again returned to Coalbrookdale, becoming foreman over a portion of the foundry, and about 1876 he obtained promotion to the charge of the chemical department and the electro-depositing of the Company, at this time building his first dynamo, which did the depositing. About 1877 he obtained a

Digitized by Google

patent for a steam pump, which was taken up and manufactured by the Coalbrookdale Company. For this he received a medal at the Inventions Exhibition. It is manufactured still by the Coalbrookdale Company. In 1880 Mr. Parker obtained a first medal at the Smoke Abatements Exhibition in London for a design of grate manufactured by the Coalbrookdale Company, called the "Kyrle" grate. Previous to this he had been promoted to the management of the engineering portion of the foundry, and in 1882 he showed Siemens and Edison's incandescent lamps at a lecture table by the aid of secondary batteries he made. He at this time discovered the action of nitric acid as facilitating the formation of secondary batteries. He took out a patent in conjunction with Mr. Elwell in 1882 (No. 3710, 4th August) in which the action of nitric acid was claimed. This patent was divided by the Solicitor-General between M. Gaston Planté and Mr. Parker so far as secondary batteries were concerned. This patent also covered several of the most important forms of alternating-current dynamos built to-day. In October, 1882, he joined Mr. Paul Bedford Elwell and started the partnership of Elwell-Parker in Wolverhampton. This he developed into a Company (Elwell-Parker, Limited) in 1884. In the same year he designed and put to work the electrical machinery of the Blackpool Tramways, remaining to the present time consulting engineer. Since 1884 Mr. Parker has made a number of inventions, both by himself and in conjunction with others, having also made the manufacture of phosphorus by electricity a success. In 1889, Elwell-Parker, Limited, was taken over with other concerns and formed into the Electric Construction Corporation, Limited, of which he is the engineer and manager. In 1890 the Wolverhampton works of the Electric Construction Corporation, Limited, in Commercial-road, being found to be totally inadequate for the work in hand and prospective, Mr. Parker received instructions to lay out elaborate works at Bushbury, just outside Wolverhampton, and under his superintendence these have been fitted with a most complete plant for the production of heavy electrical machinery. Mr. Parker has recently superintended the carrying out of several very large installations in connection with electric traction, including the Liverpool Overhead Railway and the overhead system of electric traction in South Staffordshire. Mr. Parker was made a Member of the Institution of Electrical Engineers in 1885, a Member of the Institution of Civil Engineers on December 3, 1889, a Member of the Institution of Mechanical Engineers in 1891, and a Member of the Royal Society of Edinburgh in 1892. Last year he was made a Justice of the Peace for Wolverhampton.

PARSONS, The Hon. Charles Algernon.
Born in 1854. He had a practical training in engineering at an early age, and entered Cambridge in 1872, where he graduated as Eleventh Wrangler in 1876.

In 1877, Mr. Parsons was apprenticed to the firm of Sir W. G. Armstrong. He was several years with Messrs. Kitson, of Leeds, and then became partner in the firm of Clarke, Chapman and Co., of Gateshead-on-Tyne, devoting himself to the electrical department of the firm. He resigned his connection with this firm in June, 1889, and is now head of the firm of Messrs. C. A. Parsons and Co., Heaton Works, Newcastle-on-Tyne, who are manufacturers of the improved steam turbine dynamo, unipolar dynamos, alternators, transformers, search-light mirrors, projectors, arc lamps, and all descriptions of electrical plant. Mr. Parsons is Managing Director of the Newcastle and District Electric Lighting Company and of the Cambridge Electric Supply Company, and is a Director of the Scarborough Electric Supply Company. He has read several Papers before learned societies.

PAXMAN, James N., A.M.I.C.E., M.I.M.E.
Born at Colchester in 1832.

Mr. Paxman left school at the age of 15 years, for the purpose of learning in his father's works the business of engineering and millwrighting. At the age of 19 he was requested by Mr. Charles Marriage to assist him in the management of Messrs. Catchpool and Sons' engineering and iron founding business. To this he assented. For two years the joint management continued; but at this period Mr. Marriage removed to another part of England, and at the age of 21 Mr. Paxman was appointed to the entire charge, and being particularly fond of the work, and giving his entire study to the perfecting and economical working of the steam-engine, by his energy a good and prosperous engineering trade was the result. The work consisted chiefly in making and repairing steam engines and generators. It is well to mention that at the age of 19 Mr. Paxman visited the Great Exhibition of 1851, and to this Exhibition he owes the chief cause of his success in life, inasmuch that he was so deeply impressed with the importance of his profession that he resolved to devote his entire energies to its study and practice. In 1861, the Stour Navigation Commissioners, with Mr. Stebbing as chairman, had tried to work their traffic on the river with a steam tug, and had made for this purpose a tug boat. Many experiments were carried out by several makers, but from the difficult bends in and shallowness of the river they had almost despaired of succeeding, when Mr. E. Salter, C.E., of Sudbury, advised the Commissioners to consult Mr. Paxman, who inspected the river, and suggested a favourable scheme. He was instructed to proceed with the work, and the result was practically most successful, and did both Mr. Paxman and the Commissioners great credit. In 1865 Mr. Paxman tried very hard to induce his employers to build suitable premises and procure suitable tools for their increased business, but, failing to do so, he resigned his situation with Messrs. Catchpool and Sons to commence business in connection with Messrs. C. M. and H. M. Davey. Premises were taken in the centre of Colchester, and a good business carried on. They had not been at work long when through wet seasons, Mr. Paxman was induced to bring out his patent for a machine for drying grain and other materials by steam. For this

Digitized by Google

THOMAS PARKER.

Digitized by Google

Digitized by Google

invention the Royal Agricultural Society of England awarded the firm one of their much-coveted medals given for new and useful inventions. In 1869 Mr. Paxman brought out his patent vertical boiler with circulating tubes and deflector, now known as the "Paxman" Patent Vertical Boiler, and in the trials of engines and boilers at the Oxford Show, in 1870, this proved to be the best known vertical boiler. Again in 1872, at Cardiff, Mr. Paxman was to the front at the great and, perhaps, most complete public trial of steam-engines and boilers ever made up to that date. (See the Royal Agricultural Society's *Journal* of that date.) In 1875, at the Taunton Show Trial, this vertical boiler was again tested by the engineers to the Royal Agricultural Society of England, and gave the best results of any vertical boiler on record of that date. One of Mr. Paxman's firm's engines was selected to drive a portion of the machinery at the International Exhibitions held at South Kensington in the years 1874 to 1877, and at the Philadelphia Exhibition the Paxman engine gained the only medal awarded to England in its class. In Sweden the firm's machinery had gained a great reputation, and at the Swedish Exhibition in 1871 Mr. Paxman had the honour of being introduced to King Oscar, and receiving from his own hands a gold medal. The King further graciously honoured him with a call. In 1878 Mr. Paxman patented his automatic cut-off gear, combined with a governor for effectually regulating and controlling the speed of a steam-engine. The same year the Messrs. Davey retired from the business, their interest being taken over by Mr. Paxman and his partner. At this time Mr. Paxman had introduced several improvements in the diamond industry of Kimberley, and in 1881 he undertook a journey to the Kimberley Diamond Fields, where his firm had supplied several hundred steam-engines, boilers, &c. The result of that visit was improved machinery, and Mr. Paxman read a Paper at the Institute of Civil Engineers relative to the Diamond Fields of South Africa. At the International Electric Exhibition, Crystal Palace, 1882, Mr. Paxman's engine ran so steadily and perfectly that it was retained by the jury for carrying out their experiments, and they specially commended it for its efficient and regular performances, and awarded him a gold medal. In 1883 his firm were requested to undertake the supply of motive power for driving the electric light machinery at the celebrated International Fisheries Exhibition, and were awarded a gold medal. In 1884 they were again selected for the Health Exhibition, in 1885 for the Inventions Exhibition, and in 1886 for the Colonial and Indian Exhibition, receiving on each occasion a gold medal. The large plant of steam-engines and boilers which were to be seen running there so constantly and perfectly have in large measure contributed to the success of this light. At the great competitive trial held in connection with the Royal Agricultural Society of England's Show at Newcastle, in July, 1887, Mr. Paxman carried off both the prizes offered for compound and non-compound portable engines. These trials were open to all makers. It was not so much the value of the prizes, but Mr. Paxman was anxious to show that even a better result than that obtained by him at the Cardiff trials in 1872 could be made, and the record established by him at the Newcastle trials is an extraordinarily good one, being much above those of Cardiff, and will be difficult to beat. In 1888 a competitive trial of steam-engines was invited, and again Mr. Paxman's engine thoroughly established his record at Newcastle, and was awarded the only gold medal given for steam-engines and boilers at the Society of Arts' trials (London). In 1887, Mr. Paxman was consulted by the Compagnie Parisienne, at St. Fargeau, Paris, as to a system of transmitting power by compressed air, and he designed and laid down at St. Fargeau a very large plant of steam-engines and boilers working air compressors direct for distributing air through the streets of Paris for driving prime movers. The whole plant has now been most satisfactorily at work for several years. He received a further order for another large plant for the same company, but before the work could be completed the Paris Municipality, in order to keep English houses out of the market, passed a resolution prohibiting the use of English-made machinery for the compressed air installations. Mr. Paxman much regretted this event, because the first plant had given him considerable experience, and he had hoped to introduce improvements which would have made the next plant still more efficient; but experience has proved that notwithstanding that the plant designed and arranged by Mr. Paxman was the pioneer of large plants for this kind of work, yet it remains for design, workmanship, economy, efficiency, and durability, amongst the best that are now in use. His firm was selected by the Executive Committee to supply the whole of the steam-power required for driving the machinery in the British Section of the Paris Exhibition, 1889, and his engines were selected for supplying a large portion of the motive-power in the French Section of this Exhibition, and also at the Italian Exhibition (London). In 1890 his firm were selected to provide the supply of motive power for driving the electric light machinery at the Royal Military Exhibition (London), French Exhibition (London), and were awarded gold medals. At the Mining and Metallurgical Exhibition (London), 1890, they also received a gold medal. Mr. Paxman is not one of those who can rest and be thankful, but is ever on the alert. It is well known that at engine trials he is one of the most severe competitors, and his great experience and sound practical knowledge of the requirements of steam generators and steam-engines is second to none. To-day the firm of which Mr. Paxman is the sole proprietor ranks as one of the very largest in the kingdom. Several institutions in Colchester owe much to him and to his influence and exertions, and he has rendered great service to the borough in the successful efforts he has made in permanently establishing the Albert School of Science and Art in Colchester. And, as a proof of his popularity in his native town,

Digitized by Google

we may add that he was unanimously elected by both political parties as mayor for the municipal year of 1887-1888. At the conclusion of his year of office he was presented by his fellow townsmen with a solid silver dessert service, weighing 170 ounces, in recognition of the spirited manner in which he carried out the mayoralty. Mr. Paxman is an Alderman and a Justice of the Peace.

PENDER, Sir John, G.C.M.G., M.P., son of the late James Pender, of the Vale of Leven, Dumbartonshire. Born 1816; J.P. for Kent, Middlesex, and Lancashire, and for the counties of Denbigh, Argyll, and Linlithgow; a D.L. for Lancashire; a Fellow of the Imperial Institute, and of the Royal Geographical Society of Scotland, of the Royal Societies of England and Scotland, and of the Scottish Antiquarian Society; Chairman of the Eastern, Eastern Extension, South African, Brazilian Submarine, African Direct, West African, Direct United States, Direct Spanish, Pacific and European, and European and Azores Cable Companies, of the Globe Telegraph and Trust Company, and of the Metropolitan Electric Supply Company; also Trustee of the Submarine Cables Trust; married, first, 1840, Marion, daughter of Mr. James Cearns, and secondly, 1851, Emma, daughter of Mr. Henry Denison, of Daybrook, Notts. (Lady Pender died in 1890); M.P. for Totnes, 1865-1866, Wick Burghs, 1872-85 and 1892; also contested Linlithgowshire, 1868, Wick Burghs, 1885, Stirling Burghs, 1886, and Govan, 1889. Residences—18, Arlington-street, S.W.; Foot's Cray Place, Foot's Cray, Kent; Middleton Hall, Linlithgowshire. Clubs—Brooks's, Reform, City, and Garrick.

Sir John Pender was educated at the High School, Glasgow, and after a successful career in Manchester he made the extension of submarine telegraphy his principal study, and the remarkable growth of the Companies over which he presides, is an eloquent testimony to his skill and ability in this direction. On the formation of the first Atlantic Cable Company, Sir John was one of the original 345 contributors of £1,000 towards the expenses of the necessary experiments, and, as a Director of that Company, he shared the failures and disappointments which for eight years baffled all attempts to bring the scheme to a successful issue. The snapping of the cable of 1865 in mid-ocean during the now historic voyage of the "Great Eastern" proved the financial ruin of the Atlantic Company. Many of the original supporters of the enterprise were dead, many more were utterly discouraged by repeated failures, and, with no hope of assistance from the outside public, the abandonment of the project was imminent. But, fortunately, the faith of Sir John Pender and a few others in its ultimate success remained unshaken. Through their efforts the Anglo-American Company was formed, and negotiations were opened with Messrs. Glass, Elliot and Co. and the Gutta Percha Company for the manufacture of a new cable of greater strength and value than any previous one; but the latter Company, discouraged by previous experience and unwilling to lay aside its ordinary business for one speculative undertaking, refused to proceed without a guarantee. It was at this crisis that Sir John, with the courage of genius, offered his personal guarantee for a quarter of a million sterling, and this being accepted, the two manufacturing Companies were amalgamated under the name of the Telegraph Construction and Maintenance Company, with Sir John as Chairman. The subsequent history of the enterprise is well known. Not only was the new cable successfully laid, but the broken one was recovered, and, by common consent, Sir John now became the recognised leader in this and all kindred undertakings. To his energy was due the formation of that great system of Eastern telegraphs which, now under the names of the Eastern and Eastern Extension Telegraph Companies, link together the whole of our Asiatic and Australasian possessions, and through his exertions the cables of the Eastern and associated Companies surround the great continent of Africa. Successful as a pioneer, Sir John's sound commercial instincts have stood him in good stead as an organiser and administrator. The encouragement and support which he has ever been ready to extend to inventors and men of science have given him the command of all that is newest and best in apparatus. The companies which he controls are models of efficiency and management, and while in the highest degree prosperous to their proprietors, they worthily fulfil the great mission they were designed to further. A striking instance of the work these cables are sometimes called upon to perform occurred in connection with the opening of the Colonial and Indian Exhibition of 1886, when, on the day following that ceremony, the Viceroy of India, the Governor-General of the Dominion of Canada, and the Governors of every British Colony and Dependency issued, by request of the Prince of Wales, a special gazette, containing a verbatim report of His Royal Highness's address to the Queen, of Her Majesty's reply, and also the late Lord Tennyson's ode.

In recognition of Sir John's services to the Empire Her Majesty bestowed upon him in 1888 a Knight Commandership of the Order of St. Michael and St. George, and he has since (in 1892) been promoted to a Grand Cross of the same Order. On the former occasion Lord Derby, then Secretary of State for the Colonies, presided at a complimentary banquet given in his honour.

Sir John Pender's Parliamentary career has been a long and honourable one. While he keenly feels that the integrity of the Empire should be left intact, his motto, "Telegraphs know no politics," gives him great influence on both sides of the House, and enables him, besides safeguarding the interests of the companies he represents, to serve the State, irrespective of party, in many important ways. It should be added that the cause of technical education has in Sir John a warm advocate.

JOHN PERRY.

Digitized by Google

In the course of the cruises which Sir John has taken in the interests of the telegraph companies, the Rulers of many of the States he has visited have recognised the services he has been instrumental in rendering to their subjects from time to time, by conferring upon him various high Orders. Among the honours so conferred may be mentioned the Grand Cordon of the Medjidie—the highest decoration which the Sultan can grant to a foreigner—the Knight Commandership of the St. Saviour of Greece, and the Portuguese Orders of the Conception, the Rose, and Grand Cross of the Royal Military Order of our Saviour Jesus Christ. Sir John is also an Officer of the Legion of Honour, this decoration having been conferred upon him by the French Government in 1891, in recognition of his labours in connection with the establishment and extension of Submarine Telegraphy.

In recent years Sir John Pender has devoted much attention to the electric lighting of London, being, as we have before stated, Chairman of the Metropolitan Electric Supply Company, which is the largest undertaking of its kind in this country. The Company at present (1893) supplies upwards of 165,000 lights, and Sir John's success in other electrical enterprises augurs well for its future success.

PERRY, Prof. John, M.E. (Master of Engineering), D.Sc., F.R.S., Assoc. M.I.C.E Born at Garvagh, in Ulster, in 1850.

Dr. Perry attended the Model School, Belfast. With other school prizes, won a silver medal in natural science; was apprenticed to the firm of Messrs. Coates, of the Lagan and Prince's Dock Foundries, Belfast, going through the drawing office and shops. Gained a mathematical scholarship and the Peel Prize in geometry on matriculating at Queen's College, Belfast, and afterwards many college prizes and exhibitions, graduating in 1870 as Bachelor of Engineering in the Queen's University of Ireland with first honours, gold medal, and Peel Prize. Gained Whitworth Exhibitions in 1868 and 1869, and a Whitworth Scholarship in 1870. The honorary degree of Master in Engineering was conferred on him by the University Senate in 1882, and D.Sc. in 1886. Was Lecturer in Physics at Clifton College 1870-74, and there started the first School Physical Laboratory and Workshop, still thriving institutions. Published "Elementary Treatise on Steam" (Macmillan and Co.) in 1873. Was a secretary of the A Section, British Association, 1874; and in that year became Thomson Scholar and hon. assistant to Sir William Thomson in Glasgow. Wrote many of the mathematical and physical articles in Blackie's "Cyclopædia." His first scientific Paper was read before the Royal Society of London early in 1875, on "The Electric Conductivity of Glass as Dependent on Temperature." In partnership with Sir William Thomson, he read a Paper on "Capillary Surfaces of Revolution" before the Royal Society of Edinburgh. In 1875 Dr. Perry went to Japan as joint Professor (with the principal) of Engineering in the Imperial College of Engineering, and returned to England in 1879. In conjunction with Prof. Ayrton he did so much electrical work that Prof. Clerk Maxwell jocularly remarked that the electrical centre of gravity had removed to Japan. The Papers published by the partners since 1876 are too numerous for mention. On Prof. Perry's return from Japan in 1879 he organised the works of Messrs. Clark and Muirhead, introducing large tools, machinery for the covering of wire with gutta percha, &c., and for the testing of dynamo machines. Gained silver medal of the Society of Arts in 1881 for his lecture on "The Future Development of Electrical Appliances," since translated into German by Prof. Wienhold, and published as a separate book. He arranged the system of technological examination in mechanical engineering of the City and Guilds Institute. Delivered a course of Cantor Lectures on hydraulic machinery in 1882. In that year became Professor of Mechanical Engineering and Applied Mathematics at the Finsbury Technical College. His book on Practical Mechanics is well known. He is a member of Council of the Institution of Electrical Engineers and is a Vice-President of the Physical Society. Profs. Ayrton and Perry were appointed joint engineers to the Faure Accumulator Company a few months after it began work, and remained in that capacity until the English patents were disposed of. They lighted, among other places, the Grand Hotel, Charing Cross; arranged the driving of tramcars and tricycles, experimenting on accumulators at the manufactories in Liverpool and Paris. Dr. Perry's more important inventions, made in conjunction with Prof. Ayrton, are:—Permanent magnet and spring ammeters and voltmeters, with and without commutators; solenoid and shielded ammeters and voltmeters; the secohmmeter; twisted strip voltmeter; spring balances; resistances for use with strong currents varied by foot and hand; power-meter; ohmmeter; electromotors; switches for use with accumulators, and arrangements for lighting railway trains; photometers; dynamometer couplings and transmission and absorption dynamometers; the governing of motors and dynamos; an electric tricycle; an electric railway system with friction gearing, contact boxes and locomotives, forming part of the general system belonging to the Telpherage Company, Limited. Of their inventions which are not commercially valuable may be mentioned their arrangement for "Seeing by Electricity;" their multireflex arrangement exhibited at Paris; their ballistic galvanometer, and their many forms of apparatus employed in the teaching of electricity, &c. On the death of Prof. Fleeming Jenkin, Dr. Perry became engineer of the Telpherage Company, and from July to October, 1885, superintended the erection and setting to work of the telpher line at Glynde, in Sussex. His lecture at the London Institution describing this telpher line was published in *The Electrician*. In June, 1885, Dr. Perry was elected to a Fellowship of the Royal Society. In April, 1889, the Ayrton and Perry partnership was formally dissolved. Since the dissolution Prof. Perry has written many scientific Papers, delivered the Operatives' Lecture of the B. A.

meeting at Leeds on "Spinning Tops," and taken out many patents, the most important being for a quick-speed indicator for steam-engines and an electrical supply meter.

POMEROY, Henry. Born at Westbury, Wiltshire, April 10, 1841.

Mr. Pomeroy was educated at the Diocesan School, Westbury; and afterwards privately at Hale Rectory, near Salisbury, by the late Rev. G. J. Goff, M.A. Oxon.; entered the engineer's office of the Great Western Railway Company at Westbury in 1856, and in the following year was transferred to the telegraph branch of the same company under Mr. Spagnoletti. Entered the Electric and International Company's service at Bristol in 1858, and served under Mr. R. S. Culley; was stationed at the Dutch Government Telegraph Office, Amsterdam, for six months, in 1860; returned thence to the Foreign Office, London, and then to Bristol; subsequently went to Cardiff in charge of the Repeaters on the Irish Cable circuits; afterwards to Worcester to instruct the telegraphists there in the Morse system; crossed to Dublin in 1862, where he joined the engineering branch in 1863; was subsequently engaged on board the old cable ships, "Monarch" and "Robert Lowe," assisting the late Captain Blacklock in connection with the frequent repairs of the cables off the Irish coast, near Greenore; was later on engaged on two new cable-laying expeditions, by the ss. "Dacia," under Mr. Lumsden, between Abermaur, Fishguard, and Blackwater; transferred to the Post Office in January, 1870; appointed superintending engineer in 1878; and has now charge of the Southern District of Ireland, with headquarters at Cork. Mr. Pomeroy was the first to use pure hard-drawn copper wire for city telephone systems, and one of the first to advocate its use for ordinary telegraph lines; he has also introduced the Earthenware Knob Insulator, which, being of an unbreakable nature, forms a great protection against malicious damage from stone-throwing on outlying road lines. Mr. Pomeroy has devised and introduced an improvement in the Neale's Acoustic Dial, known as the Dial Sounder; also a key which, with the receiving instrument, forms a universal set, by means of which, without any adjustment, communication can be carried on on double or single current sounder, Bell, or single-needle circuits.

POPE, Ralph Wainwright. Born at Great Barrington, Mass., August 16, 1844.

Early in life Mr. Pope developed a taste for mechanics, and having learned the operation of the Hughes type-printing telegraph in 1858, has been closely identified with electrical interests during his life. He entered the railway service in 1859, but owing to the abnormal demand for practical Morse telegraphers caused by the civil war of 1861, he soon after became one of the skilled operators on the staff of the American Telegraph Company. Arduous night-work impaired his health, and in 1865 he joined the force of the Collins' Overland Telegraph, spending a year in the wilds of British Columbia. Upon his return he again devoted his attention to electrical pursuits, and spent ten years in the Gold and Stock Telegraph Company's service. When his brother, Franklin L. Pope, assumed the editorial chair of *The Electrician and Electrical Engineer*, he became his associate, and found a congenial field in exercising that literary taste which had gradually assumed form during his long connection with telegraph interests. While holding this position he was, in 1885, elected Secretary of the American Institute of Electrical Engineers, the rapid growth of which made it necessary, in 1887, that he should devote to it the greater part of his attention, which he did at some personal sacrifice, hoping in this manner to aid in building up a creditable organisation. Mr. Pope is still secretary of the Institute. In 1888 he established a monthly journal called *Electric Power*, in association with his brother, Henry W. Pope, and Mr. George H. Stockbridge. At the Chicago Exhibition in 1893 he was appointed one of the judges in the department of Electricity, and was elected Chairman of the Sub-Committee to which was assigned the groups of telegraph, telephone, and signalling apparatus. He has given much attention to association work, and was the organiser of the Telegraphers' Protective League and the Gold and Stock Life Insurance Association.

POYNTING, Prof. John Henry. Born September 9, 1852, at Monton, near Manchester, son of the late Rev. T. Elford Poynting, Unitarian Minister, and educated first at a private school conducted by his father, and afterwards at Owens College, Manchester.

Prof. Poynting went to Trinity College, Cambridge, in 1872, graduating in the Mathematical Tripos in 1876, and being elected a Fellow of Trinity College in 1878. He took the degree of Doctor of Science, at Cambridge, in 1887. He was Demonstrator in the Physical Laboratory, at Owens College, under the late Prof. Balfour Stewart, from 1876-9, and was appointed Professor of Physics at Mason College, Birmingham, in 1880, which post he still holds. Prof. Poynting has contributed Papers to the *Phil. Trans.* on "The Transfer of Energy in the Electromagnetic Field" (1884), on "The Connection between Electric Current and the Electric and Magnetic Inductions in the Surrounding Field" (1885), and on "A Determination of the Mean Density of the Earth and the Gravitation Constant by Means of the Common Balance" (1891). In 1888 he was elected a Fellow of the Royal Society.

PREECE, W. H., C.B. Born 1834, near Carnarvon, North Wales. Educated at King's College, London. Entered Mr. Edwin Clark's (M.I.C.E.) office in 1852. Appointed to the E. and I. T. Co. 1853. Superintendent of the Southern District of E. and I. T. Co. 1856, and of L. and S.-W. Railway Co. in 1860; also Engineer Channel Islands Telegraph Company 1858; transferred to Post Office as Divisional Engineer

WILLIAM HENRY PREECE.

Digitized by Google

1870; appointed Electrician, 1877; Engineer-in-Chief and Electrician, 1892.

The remarkable gifts of Mr. Preece as a lecturer on science have brought him prominently before the general public, who crowd to the halls of the Society of Arts or the Royal Institution whenever he is discoursing on some of the electrical topics of the hour, or explaining the mysteries of some inventive marvel. His original researches for the furtherance of the special science which he cultivates, and his various practical inventions, have also won the suffrage of his fellow workers, and have given him a leading place amongst them. Moreover, the active interest which he manifests in all that relates to his profession, and the genial good-humour of the man, are of themselves enough to make him popular with electricians. Mr. Preece is consulting electrician to the British and Colonial Governments. He is a Member of the Council of the Institution of Civil Engineers, to which he was elected in 1859. He is a Fellow of the Royal Society, a member of the Physical Society, Meteorological Society, the Royal Institution, the British Association, and the Society of Arts. He was President of the Society of Telegraph-Engineers for the year 1880, and he was re-elected President of the same Society (now called the Institution of Electrical Engineers) for 1893. He is a Fellow and a Member of the Council of King's College. He was made a C.B. on January 1, 1894. Mr. Preece is the inventor of a new method of duplex telegraphy, patented in 1855; a new mode of "terminating" wires (1858); working miniature signals by electricity to assimilate electric signals with outdoor signals on railways (1862); the application of electricity to domestic telegraph purposes (1864); the application of electricity for signalling between different parts of a train in motion (1864); locking signals on railways by means of electricity (1865); improvements in railway signalling to counteract the effects of lightning (1873); a new telephone (1878); improved communication between passengers and guard (1882). He is a joint author with Mr. (now Sir James) Sivewright of a "Text-book of Telegraphy," with Dr. Maier of "The Telephone," and with Mr. Stubbs of a "Manual of Telephony"; has edited several works, and written many Papers for the scientific press, among which latter the following may be mentioned:—Before the British Association: "The Telephone," "Recent Progress in Telegraphy," "Lightning Protectors," "Recent Progress in Telephony," "Telegraphic Intercommunication," "Domestic Electric Lighting," "On the Watt and Horse-power," "On the Use of Secondary Batteries for Telegraphy," "On the Law of Incandescence and its Relation to Current," "The Relative Merits of Iron and Copper Wire" (1885), "On the Coefficient of Self-Induction in Telegraph Wires" (1887), Presidential Address to the Mechanical Section at the Bath Meeting (1888), "On the Relative Effects of Steady and Alternate Currents on Different Conductors" (1889), "On the Character of Steel used for Permanent Magnets" (1890), "On the Form of Submarine Cables for Long-Distance Telephony" (1890), "The London-Paris Telephone" (1891), "On the Dielectric of Condensers" (1892). Before the Society of Arts: "On the Phonograph," "Cantor Lectures" (1879), "Recent Advances in Telegraphy," "Recent Advances in Electric Lighting," "Electric Lighting at the Paris Exhibition," "Electrical Exhibitions," "On the Progress of Electric Lighting," "Electric Lighting in America," "Domestic Electric Lighting," "Fifty Years' Progress in Telegraphy," "On Secondary Batteries." Before the Royal Society: "Studies in Acoustics" (jointly with Mr. Stroh), "On Some Thermal Effects of Electric Currents," "On the Conversion of Radiant Energy into Sonorous Vibrations," "The Effects of Temperature on the Electromotive Force and Resistance of Batteries," "On a New Standard of Illumination and the Measurement of Light," "A Peculiar Behaviour of Glow Lamps," "On Charging Secondary Batteries," "The Limiting Distance of Speech by Telephone." Before the Society of Telegraph-Engineers: "On a New Telegraph Wire Gauge," "Telegraphy—Its Rise and Progress in England," "On the Advantages of Scientific Education," "On Lightning and Lightning Conductors," "On the Block System of Working on Railways," "On Shunts, and their Application to Electrometric and Telegraphic Purposes," "On the Measurement of Currents," "On the Phonograph," "On the Connection between Sound and Electricity," "On Winding Electro-Magnets," "On the Durability of Iron Wire," "On Radiophony," "The Behaviour and Decay of Insulating Compounds," "A Visit to Canada and the United States," "Long-Distance Telephony," "Delany's System of Synchronous Multiplex Telegraphy." Before the Institution of Electrical Engineers: "On Some Points connected with Mains for Electric Lighting," "On the Specification of Insulated Conductors for Electric Lighting and other Purposes" (1891). Before the Physical Society: "On Some Physical Points connected with the Telephone," "The Phonograph." For the Royal Institution: "On the Applications of Electricity to the Protection of Life on Railways," "The Telephone," "On Duplex and Quadruplex Telegraphy," "On Wheatstone's Telegraphic Achievements." For the Institution of Civil Engineers: "On the Maintenance and Durability of Submarine Cables in Shallow Waters," "On Railway Telegraphs and the Application of Electricity to the Signalling and Working of Trains," "On the Best Means of Communicating between the Passengers, Guards, and Drivers of Trains in Motion," "On the Progress of Telegraphy" (lecture), "On Electrical Conductors," "On the Sanitary Aspects of Electric Lighting" (Sanitary Institute, 1890), "Gas *v.* Electricity" (Association of Municipal and County Engineers, 1891), and "On the Utilisation of the Waste Forces of Nature" (lecture, 1892).

PROCTOR, C. Faraday. Born at Newcastle-on-Tyne, February 16, 1861.

After serving a regular engineering apprenticeship with Messrs. Watson and Sons, Newcastle-on-Tyne, he entered the private labora-

Digitized by Google

tory of Mr. Swan to assist in the development of his lamp. In 1881 Mr. Proctor was sent to Paris with Mr. Swinburne to start a lamp factory, they having just made a few lamps in Antwerp for the purpose of securing patent rights (probably the first practical incandescent lamps made on the Continent, November, 1881). In November, 1882, Mr. Proctor returned to England to introduce some improved machinery and to assist in the enlarging of the works at Newcastle and Low Fell. In November, 1884, he again went to the Continent to assist in the re-installing of the Lille factory of the Swan Company, which had been entirely destroyed by fire; he was appointed manager of these works in April, 1886, which post he held until the amalgamation of the Edison and Swan Continental Companies, who, under the title of Compagnie Générale des Lampes Incandescentes, decided to build a new factory at Ivry-sur-Seine, of which Mr. Proctor was appointed engineer. He then visited the various factories of both companies before taking charge of the lamp manufacture. He was presented with the bronze medal by the Jury of the Paris International Exhibition of 1889 for incandescent lamp manufacture, his company having obtained the highest award for lamps. On April 14th he rejoined the Edison-Swan Company, returned to England, and shortly afterwards was appointed assistant-manager of their works. In February, 1885, Mr. Proctor discovered the conductability and decomposition of flint, or lead glass, by the passage of an electric current through it while hot. In September, 1891, he registered a new form of lamp, having many advantages over the old form, which it is rapidly displacing. During his eleven years' connection with the incandescent lamp manufacture he has introduced many improvements in the machinery, and especially in the exhausting of the lamps, which, from being one of the most difficult departments, is now the most easy, his new pump obtaining the very highest vacua in less than fifteen minutes. Mr. Proctor is a Member of the Société Internationale des Electriciens (Paris), and an Associé de l'Association des Ingénieurs électriciens sortis de l'Institut Montefiore (Liége, Belgium).

PULUJ, Johann, Ph.D., Professor of Physics and Electricity at the German Technical High School at Prague. Born in 1845. Educated at the Vienna University.

In 1875 he became assistant at the Royal Marine Academy of Fiume, and in the following year visited the University of Strasburg, where he took his degree of Ph.D. In 1877 Dr. Puluj was assistant in the Physical Laboratory, and Docent of Experimental Physics at the University of Vienna, where for six years he lectured on the kinetic theory of gases and heat. In 1883 Dr. Puluj took up the practical side of electricity, and became manager of the Vienna branch of the firm of Ganz and Co. A year later he was appointed consulting electrician of the Waffenfabriksgesellschaft in Steyr, and manager of a factory where a glow-lamp of his was made, which was used for lighting the Electrical Exhibition held in Steyr in 1884. This Exhibition brought Dr. Puluj into prominence and he was appointed to the professorship of Physics and Electricity in the Technical High School at Prague by the Minister of Instruction, who has added to the laboratory an electrical department fully equipped with machinery and apparatus. In 1889 Dr. Puluj was elected Rector of the High School. Dr. Puluj was also assistant in the Physical Laboratory of the University, where he conducted a series of difficult experiments on the relation between the internal viscosity of gas and its temperature, the results of which, together with other works of his, are set out in the Reports of the Vienna Academy of Science. An abstract of his work on "Strahlende Materie" was published eight years after its first appearance in the *Memoirs* of the Physical Society of London under the title "Radiant Electrode Matter and the so-called Fourth State." Amongst other physical works Professor Puluj has published the following electrical treatises:—"The Unipolar Induction" (1888); "A Telethermometer" (1889); "Measurement of Temperature in the Bore-hole at Sauerbrunn by the Telethermometer" (1890); "Self-induction, and its Effects," and "Measurement of the Co-efficient of Self-induction by an Electrodynamometer and an Inductor" (1891); "The Effects of Sinusoidal Electromotive Forces having the same Direction in a Conductor of Inductance" (1891 and 1893); "A Method of Measuring the Difference of Phases of Harmonic Alternate Currents"; "A Treatise on the Difference of Phase of the Impressed Electromotive Force, and the Difference of Potential in a Branching-point of a Circuit using Harmonic Alternate Currents" and "A Phase Indicator, and some Measurements with it" (1893). Dr. Puluj is President of the Elektrotechnischer Verein in Prague, and is a member of several scientific societies.

RAVENSHAW, Henry W., A.M.I.C.E. Born in 1858.

Having served three years' pupilage in the Great Western Railway Company's locomotive shops at Wolverhampton and Worcester, from 1880 to 1883, Mr. Ravenshaw worked as draughtsman in Middlesborough, London, and Birmingham. In 1883 he was at the School of Telegraphy, Hanover-square, leaving there to go to Messrs. Edmunds and Co. as draughtsman. He has remained with the same firm (now known as Messrs. W. T. Goolden and Co.) in charge of their dynamo department ever since.

RAWSON, Frederick Lawrence, son of Sir Rawson William Rawson, K.C.M.G., C.B., and grandson of Sir William Rawson, was born at the Cape of Good Hope, July 27, 1859.

Mr. Rawson spent his early life abroad, returning to England for his education at Cheltenham and at Westminster School, at both of which places he was prominent in mathematics, natural science, and drawing. At the age of fifteen he became a pupil of Mr. C. F. de K. Steuart, during which period he went through the shops of Messrs. T. Brassey (Lord Brassey) and Co., of

Birkenhead. During the latter portion of his time he acted as resident engineer for the contractors at the Seacombe Ferry Works, whence he was called to London to work for The Electric Lighting Company, just then formed, under Mr. Steuart, later on acting as sole engineer. Whilst thus engaged, amongst other electric lighting work he took part in the Electric Lighting Exhibition at the Albert Hall. After that time he took charge of Mr. Steuart's office, and together with him was the first to report, amongst other systems, upon the Brush system of electric lighting for Baron Erlanger. He also during this time acted as engineer to Messrs. Perry and Co., contractors for the Donna Theresa Christina Railway. In 1881 Mr. Rawson went into partnership with Mr. O. E. Woodhouse, who retired from business at the end of 1885, and ultimately died in September, 1887. Between 1885 and 1886 three companies—the Woodhouse and Rawson Electric Contract and Maintenance Company, Limited, of Lancashire, Yorkshire, and Cheshire, the Woodhouse and Rawson Electric Supply Company of Great Britain, Limited, and the Woodhouse and Rawson Electric Manufacturing Company, Limited—were formed, they being practically partnerships working under the Limited Liability Acts. Of these Mr. Rawson was chairman of two and managing director of one. In 1887, just before Mr. Woodhouse's death, Woodhouse and Rawson, Limited, was formed, taking over the remainder of the business, and giving founders' shares for the goodwill and patents. Two years later Woodhouse and Rawson United, Limited, was formed, taking over all the old companies, and the works of C. L. Baker and Co., Limited, at Manchester, and later taking over the Kidsgrove Foundry, near Crewe, Mr. Sergeant's Electric Launch Building Works, Messrs. Jensen's Electric Bell business and others. Mr. Rawson is a member of the Institution of Electrical Engineers, the Society of Engineers, and the Société Internationale des Electriciens, and an Associate of the Institution of Civil Engineers. He is also the electrical member upon the committee of the Association for the Protection of Telephone Subscribers. Mr. Rawson has been prominent in the athletic world.

RAWSON, William Stepney, M.A. (Oxon.). Born 1854. Educated at Westminster School, and Christ Church, Oxford.

Mr. Rawson took his degree in the mathematical schools (1st Class, Moderations; 2nd Class, Final). After leaving Oxford he entered the scholastic profession for five years; but, compelled by ill health to abandon this, he joined, in 1882, the firm of Woodhouse and Rawson, of which his brother was a partner. At this period the firm was commencing the manufacture of incandescent lamps, and Mr. Rawson applied himself almost entirely to details in connection with this manufacture, and with photometry and standards of light; and the result of his investigations was that the firm took in hand the manufacture of Mr. A. V. Harcourt's well-known Pentane standard lamps. The manufacture of incandescent lamps having been stopped by the firm on account of patent rights, Mr. Rawson undertook for a time the investigation of the Welsbach Incandescent Gas Lamp, and succeeded in overcoming one of the greatest difficulties in its practical application by finding a method of transporting safely the fragile "mantles" which are to be rendered incandescent. Since 1887 Mr. Rawson has been employed by the Company to report upon the various processes which have been put before them, and he is also closely connected with the technical details of the various branches of the Company. He is a member of the Institution of Electrical Engineers, the Physical and other scientific societies.

RAYLEIGH, The Rt. Hon. Lord, Sec. R.S., son of the second Baron Rayleigh, of Terling Place, Witham, Essex. Born 1842.

Educated at Torquay under Mr. Warner, Lord Rayleigh entered as a Fellow Commoner at Trinity College, Cambridge, in 1861. In 1865 he graduated in the Mathematical Tripos as Senior Wrangler, and was awarded the first Smith's Prize. In 1866 he obtained a Fellowship at Trinity. Lord Rayleigh's works in physics has been of a varied and thorough character. In the years 1871 and 1872 he contributed a series of valuable Papers on Optics to the *Philosophical Magazine*, the results of which may be summed up as follows:—The blue colour of the sky is due to the scattering of light of the shorter wave lengths by the finer particles suspended in the air. Lord Rayleigh showed that the colour of this light and its polarisation could be satisfactorily accounted for on the undulatory theory; and further that to explain the observations Fresnel's hypothesis as to the nature of the vibrations and their relation to the plane of polarisation, and not that of Neumann and MacCullagh, must be assumed. Many other points of interest were discussed; in fact, these Papers, together with those of Sir G. Stokes, sum up the whole of what was then known of the dynamics of optics. In 1873 Lord Rayleigh became a Fellow of the Royal Society, and in the same year he contributed a series of Papers to the *Philosophical Magazine*, dealing with various theorems relating to vibrating systems in general. In a Paper on "Resonance," published in the *Philosophical Transactions* for 1871, Lord Rayleigh first developed a method of calculating approximately the resistance of conductors of any given form. Some of the consequences of self-induction and the effects of rapidly alternating currents in producing magnetism are amongst the subjects discussed in various Papers dealing with electromagnetic phenomena, which were published about this date. In 1877-78 a two-volume treatise on the Theory of Sound was published. In 1879 Lord Rayleigh was called on to succeed Clerk Maxwell at Cambridge, where he devoted himself to the task of completing the organisation of the then newly-founded Cavendish Laboratory. Under his supervision a system of practical instruction in Experimental Physics was devised, and it was during the five years

Digitized by Google

also that he was at Cambridge that the various electrical standards were accurately determined. The B.A. unit in terms of the ohm was given in 1883 as 0·9868; later on the electro-chemical equivalent of silver was found to be 0·0011179, and the electromotive force of the Clark cell, prepared and set up as directed, was found equal to 1·4345 volts at 15°C. Thus, by a painstaking series of investigations, requiring the highest experimental skill, Lord Rayleigh determined while at Cambridge the three fundamental units of resistance current and electromotive force. In 1882 Lord Rayleigh was President of Section A of the British Association, and in 1884, at Montreal, he occupied the Presidential chair. In 1885 he succeeded Sir G. Stokes as one of the Secretaries of the Royal Society, and a few years later he became Professor of Natural Philosophy at the Royal Institution in succession to the late Prof. Tyndall. Papers on a large variety of subjects continue to flow from his pen.

RIES, Elias Elkan. Born at Randegg, Baden, Germany, on January 16, 1862.

Mr. Ries was taken to the United States by his parents in 1865, and was educated in the public and technical schools of New York, and Baltimore, Md. While yet a mere child Mr. Ries gave evidence of considerable inventive ability. Before his ninth year he had suggested a number of improvements in the machinery and processes employed in his father's boot factory, several of which were adopted and put into practical use. On leaving school in 1876 Mr. Ries took up the study of telegraphy, which he subsequently practised as an operator in the employ of the Gold and Stock and Western Union Telegraph Companies. During this time he made and experimented with, but failed to patent, a number of inventions relating to multiplex telegraphy, telegraphic and telephonic apparatus, current regulators, &c., some of which have since been patented by others and come into extensive use. In 1881, becoming impressed with the prospective importance of the electric lighting industry, then in its infancy, Mr. Ries entered the employ of the United States Electric Light Company, and was employed in the mechanical and lamp departments at their New York factory, and while there devised a number of improvements in the manufacture of the lamps. On the removal of the factory to New Jersey he accepted positions with the Fuller Electric Light Company, and subsequently with Bergmann and Co., being engaged at the latter place on incandescent lamp-fixture and experimental work in connection with the Edison electric lighting system. In 1885-6 Mr. Ries contributed a series of articles to the New York *Electrician and Electrical Engineer*, in which he advocated as the proper solution of the overhead wire difficulty, a comprehensive and permanent system of underground avenues or subways sufficiently large to contain, and so arranged as to systematically and properly distribute, not only all present and future electrical conductors, but also to provide for a system of rapid electrical transit, and to afford accommodations for gas and water pipes, sewers, pneumatic despatch tubes, and all other forms of city service. Mr. Ries first made public the result of his experiments with electricity for increasing the frictional adhesion between driving-wheels and rails and other metal surfaces in a Paper read before the American Association for the Advancement of Science in August, 1887, and the results foreshadowed in this Paper have since been fully substantiated and confirmed. In June, 1890, Mr. Ries organised the Ries Electric Speciality Company, of which Company he is the President and general manager, for the purpose of manufacturing his regulating sockets and switches for alternating current incandescent lamps, and other valuable specialities produced by him recently, for which there is a large demand. Some of this apparatus was exhibited at the Crystal Palace Electrical Exhibition of 1892, and attracted much attention. Mr. Ries is likewise consulting electrician to the Ries Electric Traction and Brake Company of Baltimore, Md., which controls his electric traction increasing and braking patents. Mr. Ries has for some years past given much attention to the subject of alternating-current railways, of which he was probably the first advocate, and on which he has been granted a number of fundamental patents, whose commercial development is now engaging a considerable portion of his time. In conjunction with Mr. G. J. Scott, he has recently (1893) perfected the Ries and Scott single-phase, high-frequency, self-starting, non-synchronous alternating-current motor, which is at present attracting widespread attention among electricians, and, although as yet new in the art, bids fair to solve the problem of power distribution by alternating currents. Mr. Ries applied for his first patent at the age of seventeen years (1879), and the numerous inventions since patented by him embrace several distinct subjects, chief among which may be mentioned those relating to automatic railway signals and appliances, electric railway-brakes, electric tramway and railway systems, methods and apparatus for increasing traction electrically, dynamo electric generators and motors, electrical transmission and distributing systems, alternating current apparatus, electric heating, electric welding, electric riveting, and metal working, &c. Mr. Ries is a member of the American Association for the Advancement of Science, of the American Institute of Electrical Engineers, of the American Academy of Political and Social Science, and of the American Association of Inventors and Manufacturers.

RIGHI, Prof. Augusto. Born at Bologna in 1850, educated at the Bologna University.

In 1872-3 he was assistant in the department of Physics in the University. He was Professor of Physics from 1873 to 1880 at the Bologna Technical Institute, from 1880 to 1885 at the Palermo University, from 1885 to 1889 at the Padua University, and since 1890 at the Bologna University. In 1875 he was awarded the prize of 1,000 lire by the Società Italiana delle Scienze, in 1886 the same Society voted him the Matteucci gold medal, and in 1891 the

Accademia Reale dei Lincei (Rome) awarded him the royal prize. He has published many Papers on Physics, the most important being the following:—"On the Hall Phenomenon in Bismuth" (1883); "On the Change of the Electrical Resistance of Bismuth when placed in a Magnetic Field" (1884); "On the Kerr Magneto-Optical Phenomenon" (1885-6); "On Heat Conductivity in Bismuth when placed in a Magnetic Field" (1887); "Various Memoirs on the Electrical Phenomena caused by Radiation" (1888-9). Prof. Righi is a member of the Lincei Academy (Rome), and of the Academies of Bologna, Palermo, and Turin, a member of the Royal Institute of Sciences at Venice, and is one of the XL. of the Italian Society of Sciences.

ROBERTS-AUSTEN, Prof. W. Chandler, C.B. Born in the year 1843.

In 1861 Prof. Roberts-Austen entered the School of Mines with a view to becoming a Mining Engineer, for which profession, however, it was found that his health was not sufficiently robust. Mr. Graham, then Master of the Mint, secured his services in 1865, and he has been retained at the Mint ever since. In 1869, Mr. Roberts-Austen was appointed Chemist of the Mint, and after accompanying Sir C. W. Fremantle, K.C.B., the then Deputy-Master of the Mint, on a tour of inspection of European Mints in 1870, Prof. Roberts-Austen was in the following year appointed Assayer of the Mint, and subsequently entrusted with the duties of the office of "Queen's Assay Master," which is a post of great responsibility, and of much more importance than is popularly ascribed to it. In 1880 the late Dr. Percy resigned the Chair of Metallurgy at the Royal School of Mines, and Prof. Roberts-Austen was permitted to accept the Professorship in addition to his ordinary duties at the Mint. During the time he has occupied this Chair he has introduced the system of teaching the operations of metallurgy with the aid of small furnaces and "plant," and has organised visits for his students to metallurgical districts, which have been greatly appreciated by them. His "Cantor Lectures," delivered before the Society of Arts, have been translated into French and into Russian. Prof. Roberts-Austen was one of the original promoters of the Physical Society of London, of which he was one of the secretaries and became vice-president. He was appointed by H.R.H. the Prince of Wales a member of the Council of the Inventions Exhibition, and was a member of the British Executive Council of the International Exhibition of Paris, a Juror in the Mining and Metallurgical Group, and received, as Vice-President of the International Congress of Mines and Metallurgy, the Cross of Chevalier of the Legion of Honour. He was made a C.B. in 1890. With regard to his research work, he is at present engaged on a tedious investigation, part of which has already been published in the *Philosophical Transactions* of the Royal Society, the object of which is to trace the relation between the Periodic Law of Newlands and Mendeleef and the action of traces of metals or metalloids on the mass of metal in which they may be hidden. He has already obtained some interesting and important results in connection with this subject, which has always had a singular attraction for him.

ROBINSON, Prof. William, M.E. (Master of Engineering), Assoc.M.Inst.C.E., M.I.E.E., was born at Burt, near Londonderry, December 28th, 1858.

He was educated at the Academical Institution, Derry. During the session 1875-76 he attended Magee College, Derry, and gained first prize in mathematics. On matriculating at Queen's College, Belfast, in 1876, he obtained a mathematical scholarship, and was also admitted by competitive examination to the chemical laboratory under Dr. Andrews. In 1877-9 he studied in the Faculté des Sciences, University of Geneva, taking up Physics and Chemistry. In 1879 and 1880 he attended the engineering classes at Belfast, and each year gained the scholarship as well as first prizes in all the engineering subjects. At the first University examination he obtained first-class honours and the first Peel Exhibition, and in 1881 graduated as Bachelor of Engineering. At that degree examination he stood first in the Queen's University of Ireland, and was awarded first honours with the gold medal and first Peel Prize. In 1882 the Senate of the University conferred on Prof. Robinson the higher degree of Master in Engineering. Afterwards he became assistant to Prof. John Perry. Prof. Robinson's connection with the Technical College, Finsbury, dates from the first starting of the Department of Mechanical Engineering and Applied Mathematics in Cowper-street, where he acted as Prof. Perry's chief assistant, and also studied electricity. Prof. Perry entrusted Prof. Robinson with the book "Practical Mechanics," which he revised and saw through the press. In 1884 he was engaged by Profs. Ayrton and Perry, and enjoyed special opportunities in the testing of electrical instruments and machines. In the same year he was elected an Associate Member of the Institution of Civil Engineers. He is also Member of the Institution of Electrical Engineers, and of the Physical Society. During 1886 he was engaged by the firm of Messrs. Latimer Clark, Forde and Taylor in the practical testing of submarine telegraph cables at the factories, Greenwich, during manufacture. He took the final tests of part of the West African cable before and after shipment, and accompanied the ss. "Scotia" on the cable-laying expedition to the Gold Coast, where he assisted in testing and other work connected with laying the sections from Sierra Leone to Accra, Lagos, Brass, and Bonny. In January, 1887, he obtained the post of Senior Demonstrator and Lecturer in Applied Physics and Electrical Engineering, as chief assistant to Prof. Silvanus P. Thompson, at the City and Guilds of London Technical College, Finsbury. In 1890 he was appointed Professor of Engineering (Mechanical and Electrical) in the University College, Nottingham. Prof. Robinson is author of "Gas and Petroleum Engines," which is the well-known practical Treatise on the Internal Combustion Engine. He gained the Silver Medal of the Society of

Digitized by Google

Arts in 1891 for his lecture on "Uses of Petroleum in Prime Movers;" and in 1892 he delivered a course of "Cantor Lectures" on the same subject. He read a Paper on "Petroleum Oil Engines" at the Cardiff Meeting (1891) of the British Association. Prof. Robinson is author of the series of articles on "Hydraulics" and "Pneumatics" in Cassell's New "Popular Educator." During 1892, besides starting the new technical and engineering schools in University College, Nottingham, Prof. Robinson gave a course of lectures on "Applications of Electricity to Coal Mining" to the National Association of Colliery Managers (Midland Branch).

ROSCOE, Sir Henry Enfield, M.P., F.R.S., LL.D., grandson of Roscoe the historian, was born in 1833, and was educated at University College, London, and Heidelberg.

Sir Henry, who was Professor of Chemistry at Owens College from 1856 to 1886, is chiefly distinguished for his investigations and discoveries relative to the chemical action of light, and on the metal vanadium. In conjunction with Prof. Schorlemer, he published the well-known "Treatise on Chemistry" (six volumes). Sir Henry Roscoe is also the author of "Lessons in Elementary Chemistry," which has been translated into many languages, and of "Lectures on Spectrum Analysis." He is an hon. D.C.L. of Oxford, an LL.D. of Cambridge, Dublin, and Montreal, an hon. M.D. of Heidelberg, as well as member of various learned societies, and served on the recent Royal Commission on Technical Instruction, also on the Commission of Inquiry into the Pasteur Method for the Treatment of Hydrophobia; and was, in 1888, appointed consulting chemist to the Metropolitan Board of Works, with a view to the deodorisation of sewage at the Barking outfalls. In 1887 Sir Henry was president at the Manchester meeting of the British Association. He was created an Officer of the Légion d'Honneur in 1889, and delivered the Presidential Address, on October 7th in that year, at the Birmingham and Midland Institute on the subject of M. Pasteur's researches. In 1889 he was appointed member of the Royal Commission on Scottish Universities. He sits in Parliament for the Southern Division of Manchester, and is a Liberal.

ROSS, Owen Charles Dalhousie, M.I.C.E. Born January, 1823.

Mr. Ross received his early education at Darmstadt and Heidelberg; after which, at the age of eighteen, he became pupil to the then well-known but long since deceased civil engineers, Messrs. Manby Brothers, of London and Paris, with whom he proceeded three years later to Spain, as assistant in the construction of iron-works and railways in the Asturias and other parts. At the early age of twenty-three he was appointed chief of a staff of English engineers, and prepared the surveys for many of the principal Spanish railways which now traverse the peninsula, and directed the construction of a main part of the trunk line from Madrid to the Mediterranean, as well as of several other less important railways. Madrid owes its useful lines of tramway which pass through the heart of the city to his initiative and strenuous exertions. Having in 1870 acquired from the Spanish Government a large metallurgical and mining property, upon which there were vast beds of brimstone ore, with adjoining salt deposits and indications of petroleum, the recovery of sulphur from these ores, and the various applications of sulphur and petroleum, involved complicated chemical experiments and studies, to which Mr. Ross attributes his subsequent success in the application of similar principles to the generation of electricity by chemical means. In 1875 he published the results of his experience in a small volume, entitled "Air as Fuel; or, Petroleum Utilised by Carburetting Air and Rendering it Inflammable," in which he described the principles which govern the generation and measurement of heat, with some special economical applications of carburetted air used as fuel and as illuminating gas. He also contributed a Paper on the same subject to the Institution of Civil Engineers, of which he has been a member from the year 1847. Mr. Ross is the inventor of a primary battery, which has been carefully tested and approved by several eminent electricians, amongst others by Dr. J. Hopkinson. In January, 1884, the Royal Institution was successfully illuminated by its means on the opening evening of the session, and in July it was again used and exhibited in public on the occasion of the annual *conversazione* held at King's College by the President of the Society of Telegraph-Engineers and Electricians. A large house in Queen's Gate, South Kensington has been lighted for three consecutive years by one of these batteries, and this example seems likely to be followed by many other similar installations. Mr. Ross maintains that primary batteries, to be successful, require as much attention to mechanical as to chemical questions, and that in order to be generally applicable to house lighting they must necessarily be so arranged as to give no trouble to servants or other unskilled attendants. For example, he has done away with all clamps and complicated connections, and each zinc and carbon plate can be separately lifted from the battery whenever that is necessary; and, what is still more important, the liquids from all the cells are automatically drawn daily from the battery by an arrangement which involves nothing more than that a servant, or the last clerk in the office at night, is required, when leaving, to move the handle of a switch. On the following day, before the lamps are lighted, the liquid is slightly "refreshed," and the battery refilled by an equally simple process, continuing in this way to work for a month without any other attention. During the discussion at the Society of Telegraph-Engineers on Nov. 7, 1887, which followed the reading of Mr. Perry Nursey's Paper on "Primary Batteries for Illuminating Purposes," Mr. Ross mentioned that his latest improvement consists in placing all the cells of a battery so that they feed themselves continuously from one large vessel containing the solution, to or from which the liquid is supplied or drawn

Digitized by Google

off through one single inlet or outlet. When used for the supply of 1,000 or more lamps the residual products from these batteries can be wholly recovered and utilised as valuable commercial products, for which there is a large demand, which greatly reduces the cost of the electric current.

ROTHEN, Dr. Timothée. Born at Bâle in 1830.

After the completion of his scientific and mathematical studies, Dr. Rothen became, at the commencement of 1864, a partner in the firm of Hipps, telegraphic and electric apparatus makers, of Neuchâtel. In 1867 he became Secretary to the Telegraphic Department at Berne, and in 1890 he was promoted to the post of Director of Swiss Telegraphs, and was subsequently appointed Director of the International Telegraph Bureau. In 1881 he was the Swiss Delegate at the International Congress of Electricians, and in 1890 he held a similar position at the Paris International Telegraph Conference. He has written numerous works on telegraphy and telephony, some of which have been published in the *Journal Télégraphique*. In 1886 he was made a Doctor of Philosophy by the University of Berne (*honoris causâ*).

ROWLAND, Prof. Henry A.

The Rev. H. A. Rowland, father of the distinguished son of the same name, and himself a personage of no mean distinction, and of old Connecticut Congregational stock, was a graduate of Yale and Andover, and a pastor in the Presbyterian Church for nearly thirty years. It is evident that the genius of the boy soon found its object and career, and was helped on, for in 1870, when he was barely of age, Prof. Rowland graduated from the Rensselaer Polytechnic Institute at Troy as a civil engineer. The next year found him railroad surveying in Western New York, but his ability as a teacher was already recognised, and his services were called into requisition at Wooster University. In 1872 he returned to Rensselaer as instructor in physics, and in 1874 he became assistant professor. In the meantime he had completed his now widely-known experiments on magnetic permeability, but at first he was unable to get them published. The scientific journals in America rejected his work, but, confident of its value, he sent his results to Clerk Maxwell, who at once had them published in the London *Philosophical Magazine*, and wrote kindly and encouraging letters to the young investigator. He was now becoming known, and when the authorities of the newly-founded Johns Hopkins University, at Baltimore, cast about them for some one to fill the chair of physics and become director of the physical laboratory, Rowland, with his already recognised ability and with the countenance which Maxwell's recognition of his talents gave, was chosen for the place. Prof. Rowland accepted the chair, which he still holds with credit to himself and with great honour to a university that he has since then done so much toward making the great seat of American learning and the true home and sanctuary of science that we all know it to be. This was a year before the University actually opened, and the interval he spent in Europe, working in Berlin with Helmholtz. Here he investigated the effect of static electricity in motion, and proved that a moving charge has the effect of a current. While the energies of Prof. Rowland have been largely devoted to exhaustive researches into the nature and phenomena of electricity and magnetism, his work takes a broad sweep through nearly the whole range of physics. His original work has been extensive, and many of the investigations made under his direction at Johns Hopkins are of world-wide celebrity, such, for example, as his determination, for the Government, of the exact value of the ohm as the standard unit of resistance. To the public his name is probably even more familiar in connection with his large diffraction gratings, which are ruled by a method of his own directly on concave mirrors, the image of the solar spectrum being thus produced without the aid of lenses. In fact, the photographs of the spectrum obtained with the aid of these gratings far exceed anything else of the kind, and their exhibition before the National Academy of Sciences in 1883 was one of the leading scientific events of the year. The well-earned degree of Ph.D was conferred upon Prof. Rowland by the John Hopkins University in 1880. As a member of the Electrical Congress at Paris, in 1881, and of the jury at the Electrical Exhibition at the same time and place, he received the order of a Chevalier of the Legion of Honour. In 1881 he was elected a member of the National Academy of Sciences. In 1883 he presided over the Physics Section of the American Association for the Advancement of Science, at Minneapolis, and read a memorable address, entitled "A Plea for Pure Science." In 1884, being appointed by the Government on the Commission specially formed for the purpose, he presided over the deliberations of the National Conference of Electricians at Philadelphia. In 1884 he received from the American Academy of Arts and Sciences, of which he is an Associate, the Rumford medal for his researches in light and heat; the Draper Medal was also presented to him by the National Academy of Science. He has written and read many Papers on electrical and physical subjects, amongst them the article on "Screws" in the "Encyclopædia Britannica." In addition to developing the resources of the physical and electrical laboratories at Johns Hopkins, where an electrical testing bureau of great promise has also been lately established, Prof. Rowland in some manner continues to devote time to many other matters of importance. His principal work of late years has been in spectrum analysis, and in 1888-89 he published his "Photographic Map of the Normal Solar Spectrum—second series." He is corresponding member for the British Association for the Advancement of Science and of the Cambridge Philosophical Society, a foreign member of the Royal Society, is one of the twelve foreign members of the Physical Society of London, one of the ten foreign members of the Physical Society of Paris, a corresponding

Digitized by Google

member of the Institute of France and the Royal Society of Göttingen, and of many other societies. At the Chicago Congress in 1893, he was Chairman of Section A, and was President of the Chamber of Delegates for Defining Electrical Units.

RÜCKER, Arthur William, M.A., F.R.S., M.I.E.E. Born October 23, 1848, elected Mathematical Scholar of Brasenose College, Oxford, in 1867, Junior University Mathematical Scholar in 1869, Fellow of Brasenose College in 1871, and Honorary Fellow in 1891.

Mr. Rücker was Demonstrator in the Clarendon Laboratory of the University of Oxford from 1871 to 1874, when he was appointed Professor of Mathematics and Physics in the then newly-founded Yorkshire College, Leeds. He was elected a Fellow of the Royal Society in 1884, has since served upon the Council, and was awarded a Royal Medal in 1891. Mr. Rücker resigned his Professorship in the Yorkshire College in 1885. He was a candidate for North Leeds in the General Parliamentary Election of that year, and for the Pudsey Division of Yorkshire in 1886. Prof. Rücker was appointed in 1886 to fill the Chair of Physics at South Kensington, vacated by the death of Prof. Guthrie, and is President of the Physical Society of London, Treasurer of the British Association, and a Fellow of the University of London. He is the author or joint author of various scientific Papers, of which several on the electrical properties of thin liquid films were published in conjunction with Prof. Reinold, F.R.S., in the *Proceedings* of the Royal Society for 1877, in the *Philosophical Transactions* of the Royal Society for 1881, 1883, 1886, and 1893, and in the *Phil. Mag.*, Feb., 1885. He has also written on the Self-Regulation of the Compound Dynamo (*Phil. Mag.*, June, 1885); on the Dimensions of the Electrostatic and Electromagnetic Units (*Phil. Mag.*, Feb., 1889); and, in conjunction with Mr. C. V. Boys, on the "Optical Demonstration of Electrical Stress" (*Proc.* Soc. Tel. Eng., Vol. XVII., 1888). Together with Prof. Thorpe, F.R.S., Prof. Rücker has made the first complete magnetic survey of the British Isles, the magnetic elements having been determined by them at more than 200 stations. The results of the survey, including a discussion of the relations between the geological conformation of various districts and the local magnetic disturbances which occur in them, were presented to the Royal Society in the Bakerian Lecture for 1889. Since that date the work of the Survey has been very much extended, a portion of the Government Grant Fund having been allotted in the years 1890-92 to Profs. Rücker and Thorpe to enable them to carry on the work of observing and computing by the aid of assistants.

RYAN, Harris Joseph, M.E. Born in Pennsylvania in 1866. Educated at Baltimore City College, Lebanon Valley College, and Sibley College, Cornell University.

Prof. Ryan received his degree of Mechanical Engineer at Cornell University in 1887. He engaged in business as constructing engineer during 1887 and 1888. In the fall of 1888 he accepted an appointment as Instructor in Physics, being detailed to the work of applied electricity in Cornell University. Since 1889 he has served as Associate Professor of Electrical Engineering in the Sibley College, Cornell University.

Prof. Harris Ryan is a Fellow of the American Association for the Advancement of Science and an Associate Member of the American Institute of Electrical Engineers before which he has read several Papers. His scientific work and investigations are mainly along practical lines. His speciality is the design and construction of electrical machinery. He has devoted much time and energy to the investigation of armature reactive effects and phenomena affecting dynamo regulation. He has applied and investigated the method of balancing armature reactive effects by a pole face winding in series with the armature. Prof. Ryan was an active member of the Board of Judges of Awards at the Chicago Exhibition in 1893.

RYAN, John, M.A. and LL.M. (Cambridge), D.Sc. (London). Born in Newport (Monmouthshire) 1858; educated at Ratcliff College, Owens College, and King's College, Cambridge.

Dr. Ryan studied at Owens College in 1877, having obtained the third Whitworth Scholarship in Engineering. He resigned the Whitworth Scholarship and obtained in 1878 the Clothworkers' Exhibition for Natural Science, tenable at Oxford or Cambridge. He entered Cambridge in 1878 as a non-collegiate student. He resigned the Exhibition in 1880 and entered King's College, Cambridge. In the same year he was successively elected to the Vintner Exhibition and to the first Foundation Scholarship awarded for Natural Science at King's College. He passed his first B.Sc. in the London University in 1880, being placed first on the Honours list in Experimental Physics, and qualifying for the Arnott medal. In 1882 he graduated as Bachelor of Science at London, being placed in the First Class in Honours in Experimental Physics and also in Geology. In 1883 he obtained the degree of Doctor of Science, qualifying in Electricity. He graduated at Cambridge in 1881 in the Mathematical Tripos, and in 1882 and 1883 he obtained First-class Honours in the two parts of the Natural Science Tripos.

In 1883 Prof. John Ryan was appointed Superintendent of the Technical Schools, then being started at the University College, Nottingham. In 1884 Dr. Ryan was appointed Professor of Mechanics and Engineering in the University College, Nottingham. In 1885, on two vacancies occurring at the University College, Bristol, he was elected to succeed Prof. Silvanus Thompson in the Chair of Physics, and Prof. Hele Shaw in the Chair of Engineering. Since that year he has been chiefly engaged in developing the work of these departments. In 1888 he graduated as Master of Laws in the Law Tripos at Cambridge, and was called to the Bar at the Inner Temple in 1891.

SAHULKA, John. Born in Deutsch-Wagram, near Vienna, in 1857.

Mr. Sahulka was educated at the University in Vienna. He passed the examinations as Professor of Mathematics and Physics in 1882; in the same year he graduated as Doctor of Science. He taught mathematics and natural philosophy in the middle schools of Vienna from 1882-88, was then prefect at the Theresian Akademie in Vienna, then assistant for natural philosophy and electrotechnology at the High Technical School in Prague from 1889-91; since that time he has been occupied at the Technische Hochschule in Vienna as docent of electrotechnology and assistant of Prof. von Waltenhofen. He has published several Papers in the Kaiserliche Akademie der Wissenschaften in Vienna, and in the *Elektrotechnische Zeitschrift*, *Zeitschrift für Elektrotechnik*, and *Annalen der Physik und Chemie*.

SALOMONS, Sir David L., Bart. Born in 1851, on the anniversary of the Queen's coronation.

Sir David was educated partly by private tuition and afterwards at Caius College, Cambridge, graduating in the Natural Science Tripos, as the innate bent of his mind tended more to physical science than to pure mathematics. Not content with mere theoretical knowledge, he was in the habit of frequenting workshops, working with the men, and thus gaining a thoroughly practical insight into mechanical work; his uncle, moreover, provided him with a laboratory, where he could devote his attention to the subjects which interested him so deeply. He belongs to many societies, being an Associate of the Institution of Civil Engineers, a Fellow of the Royal Astronomical Society, of the Chemical Society, and of the Geological Society, and a Vice-President of the Institution of Electrical Engineers. His workshop is a large room and two small rooms full of machinery. There are machines for drilling, milling, shearing, sawing, grinding, planing, and there are lathes of different dimensions, with apparatus complete; indeed, every description of general work can be executed either in wood or metal, from the most delicate scientific instrument, whether clockwork or electric apparatus, to the roughest possible work. The whole of this machinery is driven by a number of electric motors. To the right there is a laboratory and room for photographic processes, at which Sir David is an adept and an inventor, for he introduced and exhibited at the International Exhibition of 1873 his nitro-ammonia process. He also invented an electric exposing camera in 1870, besides many electrical and mechanical improvements for railway signalling and electric improvements, and many are used with success. He was awarded a silver medal at the Inventions Exhibition, and a gold medal and diploma at the Birmingham Exhibition, 1889. Outside the workshop is a large building containing two complete installations for 500 16 candle-power electric incandescent lamps, so that each set of engines, boilers, &c., are in duplicate, with an accumulator room adjoining. Many novel devices are used with success, and no breakdown has occurred since its completion (March, 1883). There is also a powerful arc lamp on the observatory tower close by, and two small arc lamps for photography at night. All the additions to the house, as well as to the new buildings, &c., were designed and carried out by Sir David. He has written a number of Papers and pamphlets on various electrical and other matters, also books on "Electric Light Installations and the Management of Accumulators" (regarded as a text-book on the subject) and on "Photographic Notes and Formulæ." Sir David was High-Sheriff for Kent 1880-81; is a magistrate for Kent, Sussex, Middlesex, Westminster and London; is a D.L. for Kent; is a County Councillor for Kent, and was called to the Bar in 1874.

SANKEY, Henry Riall, Captain Royal Engineers. Born at Nenagh, co. Tipperary, in 1853. Educated principally in Switzerland, at Mr. Rippin's School, Woolwich, and at the Royal Military Academy, Woolwich.

He entered the Royal Military Academy in 1872 at the head of the list, a position he retained, and passed out in 1873 with honours, obtaining a commission in the Royal Engineers. He also received the Pollock Gold Medal as the most distinguished cadet of his term, the sword for exemplary conduct, the mathematical and other prizes. He distinguished himself during the course of instruction at the School of Military Engineering, Chatham, receiving the Fowke Medal for Building Construction, and was also selected to assist at the Railway Brake trials carried out in 1874 by the Royal Commission on Railway Accidents. After serving at the War Office and at Manchester he was ordered to Gibraltar, where, amongst other things, he had charge of the Military Telegraphs. In 1879 he went to Canada as Instructor in Military Engineering at the Royal Military College of Canada, Kingston, Ontario, where he published some notes on "The Use of Explosives and the Electrical Testing connected therewith." In 1882 he was ordered to Southampton to do duty on the Ordnance Survey, and was placed in charge of the stores, workshops, and electrical arrangements. He then carried out some successful experiments in depositing copper with a dynamo in connection with the reproduction by the electrotype process of the engraved copper-plate Ordnance Survey Maps, and read a Paper thereon before the Society of Telegraph-Engineers and Electricians, for which he was awarded the Fahie premium, and he also received the Paris premium the next year for another Paper on "The Deposition of Copper." Under his direction a considerable quantity of all kinds of machinery was laid down at the Ordnance Office, Southampton. In conjunction with Colonel Bolland, R.E., he has patented a new electrotype method of producing mezzotint engravings, and, in connection with Mr. P. W. Willans, an improved combination of a dynamo and engine. He has also made improvements in photogravure, and has translated Prof. Ritter's book, "Iron Bridges and Roofs," from the German. In 1889 Captain Sankey

Digitized by Google

quitted the Royal Engineers, and became a Director of Willans and Robinson, Limited, of Thames Ditton.

SCHUCKERT, Sigmund. Born at Nuremberg, 1846.

After receiving general instruction in his native town, Schuckert spent five years in various workshops in Stuttgart, Hanover, Hamburg, and Berlin, and then went to America, being employed at New York, Baltimore, Cincinnati, and Newark. In the year 1873 he returned to Germany, started a small workshop in Nuremberg, and constructed a dynamo-electric machine for electro-depositing work, known as the Flat-Ring type. He obtained a number of patents for the division of the armature current into two circuits, one of which excited the field-magnets. Other patents are:—1877, for a dynamometer; 1879, for overhead railway conductors. In 1880 he commenced manufacturing the Piette-Krizik lamp (known in England as the Pilsen lamp). After transforming his business into a Kommanditgesellschaft (limited liability company), Herr Schuckert was engaged in the construction of central stations at Barmen, Lübeck, Hamburg, Bremen, Hanover, Düsseldorf, Aachen, Altona, Christiania, Naples, Verona, &c. In 1888 the novel light projector for military and naval purposes was brought out, known as the Schuckert-Munker projector (patented also in this country), with parabolic mirrors made by a special grinding machine, and which has attracted so much attention all over the world. In April, 1893, the Company became the Elektrizitäts-Aktiengesellschaft vormals Schuckert and Co.

SELLON, John Scudamore.

Mr. J. S. Sellon has been for upwards of thirty years an active member of the well-known firm of Johnson and Matthey of London, assayers and metallurgists, and his name has for that period been associated with those of the leading scientific men of the day in matters relating to metallurgy, chemistry, and the arts and sciences generally. Quite early in the history of electric lighting Mr. Sellon interested himself *con amore* in its development, and became a devotee to the cause, and he has been a consistent advocate of its advantages and a sturdy champion for its rights from the early days. As an inventor Mr. Sellon's name stands out somewhat prominently. His many patents in connection with secondary batteries and their manipulation are amongst the earliest and the most important in that line, and have never been successfully challenged. His first patents under this head were taken out in 1881, and in that year his residence at Sydenham was fitted up throughout with the electric light, the lamps being run from accumulators; this, we believe, was the first private house in the world which was so lighted in its entirety. Mr. Sellon was, until its amalgamation with the Electric Construction Corporation in 1889, vice-chairman of the Electrical Power Storage Company, which worked his patents in conjunction with those of Faure, Swan, and others. He was for ten years (from its first initiation) vice-chairman of the Anglo-American Brush Electric Light Corporation (now known as the Brush Electrical Engineering Company), and, as is evidenced by his public statements and private work, has never wavered in his faith as to the great ultimate success of that important undertaking, which at this time seems fully assured.

SHALLENBERGER, Oliver J. B. Born May 7, 1860.

Mr. Shallenberger entered the United States Naval Academy as a cadet engineer in 1877, where he made a special study of subjects bearing on the practical applications of electricity, and experimented in the construction of incandescent lamps. He graduated in 1881, and was assigned duty on the European station. On his return in 1883 he resigned his position to pursue electrical work. He became connected with the Union Switch and Signal Company of Pittsburg in 1884, and then, soon after the organisation of the Westinghouse Electric Company, he became its chief electrician, which position he has held ever since. During this time Mr. Shallenberger has patented a number of inventions relating principally to the use of alternating currents, of which perhaps the best known is his alternating-current meter.

SHELDON, Samuel, A.M., Ph.D. Was born in Middlebury, Vt., on March 8, 1862. He entered Middlebury College and graduated with the class of 1883, as its salutatorian.

Dr. Sheldon held the position of Instructor in Mathematics in Middlebury College during the academic year 1884-1885. He entered the University of Wuerzburg, Germany, in 1885, and was appointed assistant in Physics the following year, which position he held until Easter, 1888, when he received the degree of Ph.D. Returning to America, he was appointed assistant in Physics at Harvard University. He held this position for one year, when he was called to the chair of Physics and Electrical Engineering at the Polytechnic Institute of Brooklyn, N.Y., which he still retains. He is a member of the American Institute of Electrical Engineers. He is past vice-president of the department of Electricity and present president of the department of Physics of the Brooklyn Institute of Arts and Sciences. He is the author of "Chapters on Electricity," and was the revising editor of the fourth edition of "Olmsted's College Philosophy"; and he has published many articles in the leading American scientific publications of the day.

SIEMENS, Alexander. Born at Hanover in 1847, and educated at the Lyceum and the Polytechnic College there, and at the University, Berlin.

Mr. Siemens came to England in 1867, and worked for a short time at the telegraph factory of Messrs. Siemens Brothers at Woolwich. He went to Berlin in the following year to study at the University, and remained there until 1870, with the exception of fulfilling a tempor-

Digitized by Google

ary engagement, during which he assisted in constructing the Indo-European telegraph line from the Persian frontier to Teheran and in laying the Black Sea cables at Kertch and from Sukhum Kale to Sotcha. He was next called upon to serve his country in the Franco-German war, and was present at the siege of Metz, and afterwards, under Prince Frederick Charles, joined in the operations against Orleans. He was wounded at the battle of Beaune la Rolande, and for his distinguished services in the field received the Iron Cross, a distinction conferring great honour upon the recipient. At the conclusion of the war, Mr. Siemens was again able to continue his scientific studies, and came to England, and became a pupil of the late Sir William Siemens. In 1873-4 he was conducting experiments for Sir William at Birmingham, with a rotary furnace to produce wrought iron and steel direct from the ore. On one occasion this furnace was used to cremate a pig in the presence of Sir Henry Thompson, to demonstrate the feasibility of using such furnaces for cremation. In 1875 Mr. Siemens joined the cable ship "Faraday," belonging to Sir William's firm, and took part in several cable laying and repairing expeditions. Whilst the ship was stationed at Halifax, N.S., he built some blast furnaces at Londonderry, N.S., for the Steel Company of Canada, and superintended the erection of a rotary furnace at Pittsburg, Pa., U.S.A. Returning to England in 1877 he was employed in erecting regenerative gas furnaces for various purposes in different parts of England for Sir William Siemens, among them being the first continuous working tank glass furnace erected in this country. In 1879 he became actively engaged in electrical work for Messrs. Siemens Brothers, and amongst the first electric light installations made were those at the Albert Hall, the British Museum, the Albert Docks, and the Blackpool Promenade. He also installed the electric light at Godalming, the first town in England to so light all its thoroughfares, and supply current to private consumers. Mr. Alexander Siemens became a Director of Siemens Brothers and Co., Limited, some time ago, and is now the only director residing permanently in England. In 1892 he contributed a Paper to Section G of the British Association at Edinburgh on "Electric Locomotives on the City and South London Railway." He has been for many years a member of the Institution of Electrical Engineers, to which body he has contributed several Papers of great interest to the profession, the most recent being that read on February 11, 1892, upon "Some Experimental Investigations of Alternate Currents."

Mr. Siemens was elected a Vice-President five years ago, and is the President of the Institution for 1894.

SIEMENS, Carl, M.I.C.E., M.I.E.E.
Born at Menzendorf, in Mecklenburg, in 1829. His brothers owe much to him for the energy with which he has helped to further the extension and practical application of their inventions, more especially in Russia. Since 1854 Messrs. Siemens have had at St. Petersburg a large manufactory for telegraph apparatus, dynamos, &c., which business has, with an interval of eleven years, when he assisted in directing the firm in London, been conducted by him. The network of telegraph lines which covers Russia was laid by Mr. Carl Siemens for the Russian Government. The firm also established pottery works for the purpose of making the well-known china insulating cups for telegraph posts, whilst in the Caucasus the brothers, Werner and Carl, possess copper works and oil springs. Mr. Carl Siemens was personally in charge of the laying of the Direct United States cable, the first Transatlantic cable contracted for by the firm of Siemens Brothers. He is at present director of the company of Siemens Brothers and Co., Limited, partner in the firm of Siemens and Halske, of Berlin and of St. Petersburg, president of the Russian Electric Light Company, and president of the St. Petersburg Joint-Stock Bank. He has received Orders from various countries in acknowledgment of his great services.

SIEMENS, Frederick. Born in 1825 at Menzenderf, a large property rented by his father, near Lübeck.

Mr. Siemens was educated at the Gymnasium of Lübeck up to his sixteenth year, when a desire for liberty urged him to go to sea as a sailor. After a few years he gave up a seafaring life, and came to England in 1848 to introduce his brother's (Dr. Werner Siemens) telegraphic apparatus. Owing to the monopoly of electric telegraphy then possessed by Messrs. Wheatstone and Cooke he was not very successful, and took to practical engineering with his brother William (the late Sir William Siemens), who had lately applied the regenerative principle to steam-engines. Mr. F. Siemens succeeded in applying it to furnaces, in combination with gaseous fuel, whereby a great saving has been effected in fuel, and very high temperature produced. His regenerative gas furnace has made possible the production of open-hearth steel, and of glass melting by the continuous process in tanks. Mr. Siemens is also the inventor of the regenerative gas burner and stove, the former of which gives out a brilliant light, and the latter an intense heat, these effects being produced with a saving of two-thirds the gas formerly used. He has also brought out many inventions connected with the glass industry, and possesses four factories in Saxony and Bohemia, employing over 4,000 men. While his principal achievements are to be found in the fields of invention and industry, he has likewise distinguished himself in scientific research, and has given Papers and lectures before scientific societies in this country. Among them may be mentioned those on "Heating by Radiation," "Distributing Light and Heat," "Tempering Glass," "Dissociation," and "Combustion," all of which he has treated both from the theoretical and practical points of view.

SINCLAIR, Dane. Born in Caithness, June 6, 1852.
Mr. Sinclair's first connection with telegraphy

Digitized by Google

was in the engineering branch of the telegraph department of the North British Railway, which he joined in 1872. In 1875 he was selected to proceed to Japan in the service of the Japanese Government as Inspector of Telegraphs, and remained there for five years. His experience in the construction, maintenance and working of telegraphs in that country prepared him for the varied experience which he has had since his return from that country in 1879. He then joined the Dundee and Arbroath Joint Railway in charge of the telegraph and stores department, where he took out his first invention, this being a patent for waggon cover fasteners, which effected an enormous saving in railway stores. In 1882 he was appointed Engineer to the National Telephone Company for the Glasgow District, and shortly afterwards became electrician to the Company in addition. While in Glasgow he invented several appliances for telephone service, some of which have come into general use. Among these may be mentioned the single cord switchboard, now so largely used throughout the country; the automatic switchboard system, described in Preece and Maier's Book of Telephony; the automatic call box; Sinclair's patent solder, in which the resin is contained in a tube of solder; a ring-off system for exchanges; a horizontal multiple switchboard, &c., &c. On the amalgamation of the three principal telephone companies in the country, he was selected by the Directors of the newly-amalgamated Company to examine and fully report on the entire telephone system and management of the metropolis; and on the basis of this report the reorganisation of the system was carried out, Mr. Sinclair being appointed to the important position of London Manager, and in June, 1892, he was promoted to the responsible position of Engineer and Electrician-in-Chief over the entire system of the National Telephone Company, which he continues to hold. He is a Member of the Institution of Electrical Engineers. He has written several Papers for the Glasgow Philosophical Society, of which he was a member of the Council, and has published in *The Electrician* a series of Papers on improvements in telephony in Scotland.

SNELL, Albion T. Born August 2, 1858.

Mr. Snell comes of a Devonshire family, and was educated at St. Clement Danes Grammar School and King's College, London. At the latter, in the Applied Science Department, under Prof. Grylls Adams, he studied civil and electrical engineering, worked in the Wheatstone Laboratory, and experimented in physics, mechanics, chemistry, and electricity. He also attended the City and Guilds Technical College; and there, under Profs. Ayrton and Perry, made an elaborate course of experiments with dynamos. Among others, he has held the appointment of assistant to Mr. J. Swinburne on the staff of the late Hammond Company. There, in conjunction with his chief, he carried out some most important work in connection with electrical measuring instruments, accumulators, motors, and dynamos, and more especially in relation to the designing of motors and dynamos for constant E.M.F., current and speed, &c. In the year 1885 he joined Messrs. Immisch and Co., and at the Inventions Exhibition he represented that firm, which succeeded in obtaining the Silver Medal for improvements in motors. During the year he was appointed electrical engineer to the same firm; and at once vigorously attacked the question of transmission of power by electricity. As early as 1886 he had completed the design of the present standard type of the well-known "Immisch" motor, and before the expiration of that year had successfully installed it for a variety of purposes. About this time he studied the application of electricity to mining work; and in 1887 designed and worked a 70-H.P. pumping plant at St. John's Colliery, Normanton, which was then the largest transmission plant in the United Kingdom. This was soon followed by other plants of a similar character, suited to the various requirements incidental to mining. In many respects he may be regarded as the pioneer of electrical mining work. He has also given his attention to tramcar and launch work. On the absorption of Messrs. Immisch and Company by the General Electric Power and Traction Company in May, 1890, he was appointed chief engineer to the new Company. His command included the whole of the general business of the Company, and the mining, tramcar, and launch departments. The electric trams on the section of the North Metropolitan Tramway Company at Barking received his immediate attention, and he designed new motors with positive gearing, on self-contained frames, especially for them. He also attacked the general problem of accumulator cars, building steel under-frames and special motor-trucks to stand the increased weight. In May, 1892, he severed his connection with the General Electric Power and Traction Company, and is now practising as a consulting engineer in London and Sheffield. During the last two years he has given special attention to alternate-current —single and multiphase—working; in connection with which he read a paper before the Institution of Electrical Engineers, entitled, "The Transmission and Distribution of Power by Alternate Currents," in the spring of 1893; and also one at the British Association meeting at Nottingham on "The Utilisation of Waste Water Power by Electricity." He is engaged in writing a book for *The Electrician* Series, to be entitled, "Electric Motive Power," which is designed to be a *vade-mecum* for users of electric power plant. Mr. Snell is well known in connection with the literature of dynamo and motor design and the application of electricity to mining work. He is an Associate Member of the Institution of Civil Engineers, Member of the Institution of Electrical Engineers, and Member of the Federated Mining Institute of England.

SPAGNOLETTI, Charles Ernest Paolo della Diana, was born 1832, at Brompton; and was educated at Blemmell House, Brompton. Mr. Spagnoletti is a descendant of the illustrious and noble family of the

Digitized by Google

ALBION T. SNELL.

Digitized by Google

Digitized by Google

Dianas of Sicily and Italy. The name of Spagnoletti was given by popular voice to his grandfather Paolo della Diana, which he adopted. He came to this country about 1798.

On commencing active life, in 1846, Mr. Spagnoletti was engaged for a short time in the Actuary's Department of the National Debt Office, and afterwards took an appointment under Mr. Alexander Bain, the inventor of the chemical printing telegraph, with whom he worked, and assisted in carrying out many early experiments in the development of this system of telegraphy, until the Electric Telegraph Company opened their central station at Founder's Court, Lothbury, in January, 1847, when he commenced his service with that company, representing them in several towns in England until he entered the service of the Great Western Railway Company, in 1855, as chief of the telegraph department, where he at once began to organise a system, drawing out a book of rules and special codes to meet the requirements of railway working, which laid the foundation of the regulations now in use on every line in the kingdom, and he has been aptly termed "Father of Railway Telegraphy." When the Metropolitan Railway in 1865 was opened, it was worked by the Great Western Railway, and in order to meet the requirements of an anticipated heavy traffic and quick succession of trains Mr. Spagnoletti brought out, in 1865, his disc block instrument for controlling the traffic of this line, and drew out the regulations therefor. On the opening of the District Railway the same system was adopted, and he constructed the telegraphs for both these lines. His block system is also in use upon the Great Western Railway and some other railways at home and abroad. He also arranged this instrument to work on the 1, 2, and 3 wire systems. Finding the effects of lightning were exceedingly dangerous to the working of the block system, by weakening, neutralising, and reversing the signals, he next invented his induced coil, which entirely removed these dangerous results; and this invention is now generally used in all needle instruments, its advantages being so manifest that the Government and all railway companies using needle instruments have adopted it. Keeping his attention to improvements in railway working by electrical appliances, he introduced an instrument to indicate to signalmen the position of the "semaphore arm" when from any cause it is out of the sight of the signalman working it, and also an apparatus for showing whether the signal lamp is "in" and burning properly or "out" at such signals. He also designed, in the year 1868, a large telegraph board for Ascot race course, showing the starters and winners of the races. This is electrically worked from the weighing room and judge's box, about half a mile distant. This at the time was the largest piece of electrical machinery ever made, and was designed at the request of the Earl of Cork and Orrery, Master of the Buckhounds, with a view of dividing the crowd, which was yearly increasing, as the rush to obtain the numbers was getting serious. Mr. Spagnoletti has also patented many improvements, such as electrical signals, electrical appliances for working railway drawbridges over rivers and docks, so that no train can be signalled and allowed to pass over it until these bridges are in proper position; locking block instruments of various kinds; also a system for electrically locking the signal and point levers, so that the signalman at the station in advance may control (as regards sending trains forward) the working of the signals at the station in the rear; and for controlling immediate sidings, drawbridges, &c., and adding to the safety of railway travelling both on double and single lines, the trains by this system performing part of the working themselves, controlling and checking the signalman at each end of the section, which system is used on several lines of railways; a system of various fire alarms for towns, districts in large cities, and for lunatic asylums and other large establishments; also an electric bell, by which any number can be worked and kept ringing on a single line wire; an electric tell-tale clock for asylums, by which a record is made of every visit paid throughout the night to each room or particular spot appointed, showing the duration of each visit, and the time occupied in getting from one room to the other. This clock is also applicable to railway signals, so that the exact time a signal arm is either at "danger" or "all right" is recorded, and the register can at any time be examined. In the year 1873 he brought out a polarised relay; and in 1881 patented a dynamo electric machine and a system of communication between passengers and guards; also an electric motor and an arrangement for protecting trains in station-yards while shunting and standing on the wrong lines; also a system for railways worked by electricity, for controlling approaching trains from the signalman's cabin at the station in advance in connection with the electric locking of signals, so that the "current" is "cut off" from the charging rail or conductor of the signals and put to danger to stop a train, or, in case of emergency, the signalman can, if it is necessary, stop an approaching train by depriving it of its power of motion. In 1889 he was appointed consulting electrical engineer for the City and South London Railway (the first electrical railway), and advised as to the mode of working this line and in drawing out the specification for the mechanical and electrical plant, for powers, &c., &c. Mr. Spagnoletti was President of the Society of Telegraph-Engineers and Electricians for 1885; he is a Fellow of the Imperial Institute, a member of the Institution of Civil Engineers, of the Society of Arts, of the Physical Society, and of other institutions. He was a juror of the Paris Exhibition in 1878 for the Electrical Department, and member of the Congress and exhibitor at the Electrical Exhibition of Paris, 1881, and received a silver medal; also juror and exhibitor at the Crystal Palace, 1882, and on the General Committee and juror of the Electric Lighting Department of the International Health Exhibition of 1884, and the Inventions Exhibition, 1886. He was for thirty-seven years chief electrician and telegraph-engineer of the Great Western

Digitized by Google

Railway, and is now consulting electrical engineer to that Company. He is also managing director of the Phonopore Company, Limited.

SPRAGUE, Frank J. Born at Milford, Connecticut, U.S.A., on July 25, 1857.

Mr. Sprague spent most of his boyhood in circumstances not by any means too affluent, at North Adams, Massachusetts. Early in 1874, a notice being published in the Boston papers of a competitive examination for candidates for appointment at the Annapolis Naval Academy, he made up his mind to seize the chance. He was successful, and, borrowing the money needful to give him a fair start, he entered the Academy that year. He finished a four years' course in 1878, graduating seventh in a large class. Early in 1880 Mr. Sprague was promoted, and enjoyed much-prized opportunities for electrical work at the Stevens Institute, Hoboken, and at the Newport torpedo station. While at Newport he had the benefit of meeting and exchanging ideas with that Nestor of American electricity, Moses G. Farmer. In 1881 he was sent off to the Mediterranean on board the U.S. s.s. "Lancaster," and in 1882 he was detailed to the Crystal Palace Electrical Exhibition to report for the Government. He was made a member of the jury, being the only American on it, and was also made secretary of his section. His report to the Navy Department was an excellent piece of work in every way, and being now quite rare, is highly valued by all who have copies of it. It need hardly be said that the Exhibition afforded him many opportunities that were eagerly caught at for renewed experiment, especially in the field of electrical power, which he had convinced himself was the next great outgrowth of practical electricity. He had also made the acquaintance of progressive men of like tastes and ideas with himself, among whom may be specially mentioned Mr. E. H. Johnson, at whose invitation, in 1884, he joined the Edison ranks. Coming directly in contact with practical work in this way, Mr. Sprague was confirmed more than ever in his belief as to the possibilities of the electrical transmission of power, and he resolved to devote himself entirely to the problems awaiting solution in that field. Mr. E. H. Johnson encouraged him, and being thus enabled to put his ideas and inventions in form, Mr. Sprague went to the Philadelphia Electrical Exhibition with several motors bearing his name. The result was as might have been expected. The work done by the motors, and the ingenious principles involved, created so favourable an impression that the formation of the Sprague Electric Railway and Motor Company was a matter of course, and, in fact, the company was barely formed before it was overwhelmed with business. Since that time the industry thus started has grown wonderfully, and, thanks largely to the genius of Mr. Sprague, as well as the steadiness and foresight with which he has been accorded support, difficulties that once seemed insuperable, whether in stationary work or the operation of street railways, have been triumphantly overcome. All this work has been done in but a few years, and it is no small honour for such a young man as Mr. Sprague that his part in the great revolution has been so prominent. Without deep-seated confidence in himself Mr. Sprague would never have grappled with some of his undertakings, such, for example, as the now celebrated road at Richmond, Virginia, the attempt to operate which was looked upon by several of his friends as sheer madness, but which embodied many of the features and devices that have already become standard and essential to success. While it is true that Mr. Sprague's hard-won reputation rests very largely upon his achievements in the domain of electrical power, it is worthy of note that other subjects have received his attention, and that he has made inventions in other fields.

STALLIBRASS, Edward. Born at Eastwoodbury, Essex, 1862. Educated at Nassau School, Barnes.

Mr. Stallibrass began his career in 1881, becoming articled to the late Sir Charles T. Bright, M.I.C.E. During the Electrical Exhibition of Paris in 1881, he assisted Sir Charles, who was a Commissioner for Great Britain, and subsequently studied at King's College, London, under Prof. Adams, F.R.S. Adopting submarine cable work as his particular branch of engineering, he joined the staff of the India Rubber, Gutta Percha, and Telegraph Works Company, and whilst with them assisted in the manufacture and laying of the following submarine cables: Central and South America Telegraph Company's cables, between Tehuantepec, La Libertad, San Juan del Sur, Panama, Pearl Islands, Buenaventura, St. Helena, Payta, and Chorillos; the Spanish National Telegraph Company's cables, between Cadiz, Teneriffe, Grand Canaria, La Palma, St. Louis, and Dakar; the African Direct Telegraph Company's cables, between the Cape Verde Islands and Bathurst, and between St. Paul de Loanda, Benguela, and Mossamedes; the West African Telegraph Company's cables, between Dakar, Bathurst, Bulama, Bissao, Konakry, Sierra Leone, Accra, Grand Bassam, Porto Novo, São Thomé, Principe, Gaboon, and St. Paul de Loanda, and between Bonny and Principe; Lloyd's Tory Island cable. He assisted on board the "International" during her survey of the North Atlantic bed, between Spain and the Canaries, and on the "Buccaneer" during her sounding work off the Coast of Africa, from Sierra Leone to St. Paul de Loanda, under the direction of Mr. J. Y. Buchanan, F.R.S. He has also been out on numerous repairing expeditions. In 1890, he accepted an appointment offered him by Mr. W. Sharpey Seaton, and has since been actively engaged in the carrying out of his contract for the laying of some 2,500 miles of cable for the Société Générale des Téléphones of Paris, between the following places in the West Indies: Puerto Plata, Martinique, Surinam, Cayenne, Vizeo; as well as between Port au Prince and Mole St. Nicholas, and Fort de France and St. Pierre. He became a Student of the Institution of Electrical Engineers in 1882, an Asso-

Digitized by Google

ciate in 1885, and a Member in 1887. He was a Student at the Institution of Civil Engineers in 1882, and in 1883 was elected an Associate Member. He is also a Fellow of the Royal Geographical Society, and has contributed to their Magazine. He read a Paper before the Institution of Electrical Engineers, in 1887, on "Deep Sea Sounding in connection with Submarine Telegraphy," which was awarded the Fahie premium. He is the inventor of a new form of detacher for deep sea sounding sinkers, and of an improved grapnel for submarine cables.

STATTER, John Grice. Born 1852 at Wakefield.

Mr. Statter is the fifth son of W. Statter, F.R.C.S., and was educated at the Grammar School, Wakefield, and at Sandringham School, Southport, and afterwards at the Yorkshire College, where he studied electricity, physics, and engineering, and worked for a short time at the Physical Laboratory under Prof. Rücker. He took first prizes for engineering field work, engineering construction, mechanism and machinery, and for electricity, and was second in physics. In 1882 he turned his attention to practical work, took out a patent for an arc lamp and other apparatus connected with electric lighting, and started an installation of arc and incandescent lights at his father's house, The Old Hall, Snapethorpe, near Wakefield, using a Robey undertype engine and a Crompton "C" Bürgin dynamo. The lamps used were Swan's, and were in three groups of seven each, placed in series with two arc lamps, one of which was employed to light a tennis court. In the summer of 1883 he entered the works of Messrs. R. E. Crompton and Co. as a pupil. In the autumn of 1885 he commenced business with Mr. S. L. Brunton, at Middleton-road, Dalston. Towards the end of 1886, finding the premises at Middleton-road too small, they removed to the Alliance Engineering Works, at West Drayton, near London. Subsequently he became managing director of Messrs. J. G. Statter and Co., Limited; and upon the amalgamation of this firm with their London agents, the United Electrical Engineering Company, Limited, he became joint managing director of the amalgamated businesses carried on as The Electrical Engineering Corporation, Limited, of Princes-mansions, 68, Victoria-street, Westminster, and Alliance Engineering Works, West Drayton, Mr. Edward Manville being his co-managing director. Mr. Statter is now a partner in the firm of J. G. Statter and Co., Limited, carrying on business as electrical engineers at Princes-mansions, 68, Victoria-street, London, S.W.

STEARN, Charles Henry. Born in Jamaica 1844; educated at the Islington College. Entered the Bank of England, London, in 1862; was appointed to their Liverpool Branch in 1864. Matriculated at the University of London in 1865.

While in the service of the Bank of England Mr. Stearn devoted the whole of his leisure time to the pursuit of physical science. He became a member of the Council of the Literary and Philosophical Society of Liverpool, in whose work he took an active part, and contributed several Papers to their *Proceedings*. He was one of the founders and the first secretary of the Microscopical Society of Liverpool. In 1872 he commenced (in conjunction with Mr. G. H. Lee) a series of researches on the variations caused in the spectra of incandescent gases by changes of pressure and temperature, and communicated a short Paper on the subject to the *Proceedings* of the Royal Society. In the course of this investigation he gained the experience of the precautions necessary to be observed in the production of extremely refined vacua, as well as the influence of the surface impurities of the containing glass vessel on reducing the degree of exhaustion, which was afterwards so valuable in its application to incandescent lamps.

In 1877 Mr. Stearn exhibited before the British Association at Plymouth a portable form of Sprengel pump, in which the bulk of the air was removed by a mechanical pump, and the fall tubes of the Sprengel being in connection with a partially exhausted receiver, the length of the fall tubes was reduced to a few inches. In November of the same year Mr. J. W. Swan, of Newcastle, first made Mr. Stearn's acquaintance, and being familiar with his skill as an experimenter in the production of high vacua, proposed to him to enter on a joint research having for its object the solution of the problem of domestic electric lighting by means of the incandescence of thin carbon conductors in vacuo. Mr. Swan produced at this time some of the thin strips of carbonised paper which had been used by him in his former experiments some twenty years previously. The first lamp was constructed by Mr. Stearn at his residence at Rock Ferry, near Liverpool, in November, 1877, and from that time the research was continued at intervals till the publication of the results in September, 1880, the carbons being prepared by Mr. Swan in Newcastle, and the rest of the investigation conducted by Mr. Stearn at Rock Ferry, the results and suggestions being communicated by the *collaborateurs* to each other by letter. After the successful result of the experiments a larger laboratory was fitted up in the house adjoining Mr. Stearn's, and the foundations of a commercial manufacture were laid by training a few operators and devising the necessary apparatus. After the publication of the results and the exhibition of the new incandescent lamps in Newcastle and London, a company was formed, under the chairmanship of Mr. J. S. Stevenson, M.P., for the commercial exploitation of the invention, and Mr. Stearn at once entered on the task of organising the manufacture at Newcastle, having been appointed general technical manager. Shortly afterwards he superintended the establishment of another factory in Paris for the firm of J. Wilson Swan and Co., in which he had become a partner. On the formation of the Swan United Electric Light Company in London in 1882, the English and Continental businesses in Swan lamps became united, and

Digitized by Google

Mr. Stearn was appointed general manager of the Company's factories at home and abroad. Mr. Stearn now removed to London, and subsequently directed the establishments of the Swan factories at Lilie and Cologne. In 1883 he was appointed a director of the Swan Company, and after the formation of the Edison-Swan Company and the separation for the second time of the English and foreign businesses, he resigned his connection with the English Company, and was appointed managing director of the Swan Company, which retained all its foreign patents and business, in 1885. In September, 1889, he terminated his connection with the Swan Company, and assumed the direction of the Zurich Incandescence Lamp Company at Birmensdorf, near Zurich, and London. Mr. Stearn is a member of the Institution of Electrical Engineers and the Physical Society of London, and a Fellow of the Royal Microscopical Society.

STEINMETZ, Charles Proteus. Born in Breslau, Germany, in 1865. Entered the University of Breslau in 1882, where he studied pure mathematics, astronomy, physics, chemistry, electro-technics and medicine.

After a short stay in Berlin in 1887, he found it advisable for political reasons to leave Germany, and went to Switzerland in 1888, where he entered the polytechnic school at Zürich, and studied mechanical engineering. In 1889 he went to the United States of America, where he became connected with the Eickemeyer and Osterheld Manufacturing Company in Yonkers, N.Y. On the consolidation of the Eickemeyer interests, in 1893, with the General Electric Company he joined the latter Company, and removed to Lynn, Mass. Since 1890 he has been carrying out an extensive research on the energy function of the magnetic circuit.

STOLETOW, Alexander G., Dr., Professor of Physics in the University of Moscow (Russia). Born in Vladimir, 1839; educated at the Gymnasium there, and at the Universities of Moscow, Heidelberg, Gottingen and Berlin; from 1862-65 he worked in the laboratories of G. Kirchhoff and W. Weber.

He graduated Master of Physics (Moscow), 1869, and Doctor of Physics, 1872. Appointed Lecturer of Physics at the University of Moscow, 1866; Extraordinary Professor, 1872; Ordinary Professor, since 1873; Emerit. Ord. Professor, 1891; hon. Member of St. Vladimir's University of Kieff, 1884; hon. Member of the Society for Natural Science, Moscow, 1886 (during 1881-89 President of the Physical Section); Member of the Mathematical Society, Moscow; Physico-Chemical Society, St. Petersburg; Société Française de Physique (Membre du Conseil 1888-90), Société Internationale des Electriciens (Membre du Conseil pour la Russie, 1891); Foreign Member of the Institution of Electrical Engineers, London. Was Member of the First Electrical Congress at Paris, 1881, and Member of the Jury (vice-president of Group IV.) at the Paris Electrical Exhibition, 1881; vice-president of the Second Electrical Congress at Paris, 1889. Author of many Papers on General Physics and Electrical Science in Russian and foreign periodicals. The chief electrical Papers are: "On the General Problem of Electrostatics" (purely theoretical); "On the Magnetization Function of Soft Iron" (contains the first exploration of the susceptibility-curve); "On a Determination of Maxwell's c" (by method of repeated discharge of an air-condenser of known dimensions); "On Contact Electricity" (versus F. Exner); "On Kohlrausch's Measurement of the Mercury Unit of Resistance" (calculation of self-induction); "On Actino-Electrical Phenomena" (a series of Papers on the dispersion of electricity of feeble tension under the action of ultra-violet radiations, on actino-electric cells, on a method of measuring contact electricity, &c.); "Ether and Electricity" (Address at the meeting of Russian Naturalists, 1890; &c., &c.

STROUD, Henry, M.A. (Camb.), D.Sc. (Lond.) Born in Bristol, August 7, 1851. Educated at Bristol Grammar School, University College, Bristol, Owens College, Manchester, and St. John's College, Cambridge.

He obtained the First Entrance Scholarship in 1879 at Bristol University College, and commenced the study of Physics under Prof. Silvanus P. Thompson. In June, 1880, he matriculated eighth in honours at the London University, and was awarded the Gilchrist Scholarship, tenable at Owens College, where he worked under Profs. Balfour Stewart and Sir Henry Roscoe till June, 1882. While at Owens he obtained the Heginbottom Scholarship for Physics and the Dalton Junior Mathematical Scholarship, and passed the Intermediate Science Examination at London, being placed first in the 1st class in the Honours Examination in Physics with the Neil Arnott Exhibition and Medal. In April, 1882, he was elected to a Foundation Scholarship of £100 per annum, tenable till of M.A. standing, at St. John's College, Cambridge, and commenced residence at Cambridge in October, 1882. He graduated B.Sc. at London in 1883, being placed in the Honours Examination first in the 1st class for Physics and first in the 1st class for Chemistry with the University Scholarship. In the Mathematical Tripos List of 1885 he was bracketed eighth Wrangler, and in 1886 was placed in the First Class for Physics in Part II. of the Natural Sciences Tripos, and obtained the Hockin Prize for Physics at St. John's College. He graduated Doctor of Science in the University of London in 1886, taking Electricity as his subject. On the resignation by Prof. A. S. Herschel of the active duties of the Chair of Physics at the Durham College of Science, Newcastle-on-Tyne, in 1886, Dr. Stroud was appointed Lecturer on Physics and Superintendent of the Laboratory, and in 1887 was elected to the Professorship of Physics, which post he has since held. During the visit of the British Association to Newcastle in 1889 Dr. Stroud acted as one of the secretaries of Section A.

For the last few years Dr. Stroud has been actively engaged in developing the Physical Department in connection with the extended work which the Durham College of Science

Digitized by Google

JOSEPH WILSON SWAN.

Digitized by Google

has recently undertaken ; and in conjunction with the Principal, Prof. Garnett, has devoted special attention to the technical education of students intending to become electrical engineers. He is a member of the Physical Society of London, and an honorary member of the North of England Institute of Mining and Mechanical Engineers.

STROUD, William, M.A. (Oxon.), D.Sc. (Lond.) Born in Bristol, February 2, 1860. Educated at the Bristol Grammar School ; University College, Bristol ; Owens College, Manchester ; Balliol College, Oxford ; and at the Universities of Heidelberg and Würzburg.

Prof. Stroud in 1879 gained the Gilchrist and Heginbottom scholarships at Owens College. In 1880 at the Intermediate Science Examination, in the University of London, he was placed first in the first class in chemistry, was awarded the University Exhibition, and was placed second in the first class in physics, and awarded a Neil Arnott medal. In 1881 he graduated as Bachelor of Science, being placed first in the first class in chemistry, with the University scholarship, and being placed in the second class in physics. In the same year he entered Oxford as a Brackenbury Scholar at Balliol, having decided to relinquish chemistry in favour of physics. He gained a first-class in the Final Mathematical School in 1884, and a first-class in the Science School, 1885. During the session 1884-5 he was studying physics under Profs. Quincke at Heidelberg, and F. Kohlrausch at Würzburg. In June, 1885, he graduated as Doctor of Science in the University of London, and was appointed to succeed Prof. Rücker in the Cavendish Chair of Physics at the Yorkshire College, Leeds. For the last six years, in conjunction with Prof. Barr, of Glasgow University, his spare time has been almost entirely devoted to the subject of Range-Finders for naval, military, and surveying purposes.

SUMPNER, W. E., D.Sc.

Dr. Sumpner was educated at University College, London, and at the Central Institution, South Kensington. At the former college he obtained the Rothschild's Exhibition for Mathematics, and at the latter the Clothworkers' Scholarship. He is a scholar in Physics of the London University, and a Fellow of University College. In 1887 he obtained the Paris Premium of the Society of Telegraph-Engineers for a Paper "On the Measurement of Self-Induction, Mutual Induction, and Capacity," and has contributed occasional Papers to the Physical Society of London, and to the Royal Society. In 1892 he was elected a Member of Council of the Physical Society, and has recently attained a similar distinction among the members of the Institution of Electrical Engineers. For some years he acted as Lecturer and Demonstrator in the Electrical Department of the Central Institution. This position he resigned on being appointed to take charge of the Electrical Department of the new Polytechnic at Battersea, London.

SWAN, Joseph Wilson, whose name is so widely known in connection with the invention of the incandescent electric lamp, was born in 1828, at Sunderland, and was educated at a private school in that town.

Mr. Swan at an early age entered the business of a chemist. While pursuing an active commercial life he yet found time for much scientific work, chiefly in the fields of photography and electricity, and he has left strong marks of his research and his inventive faculty in connection with both these departments of applied science. These are seen most conspicuously in the invention of the carbon or autotype photographic process, and the incandescent electric lamp. Our space does not permit us, nor does the occasion require us, to describe these inventions, nor to mention in detail the other inventions due to Mr. Swan's knowledge and ingenuity. Suffice it to say, these are both numerous and useful. Mr. Swan is a Fellow of the Institute of Chemistry, and of the Chemical Society ; and a member of the Institution of Mechanical Engineers and of the Institution of Electrical Engineers. He is also a corresponding member of the Philosophical Society of Glasgow, Master of Arts of the University of Durham, and Chevalier of the Legion of Honour of France.

SWINBURNE, James. Born at Inverness, February 28, 1858, and educated at Clifton College.

Mr. Swinburne served an apprenticeship of six years at a railway works and at Messrs. Black, Hawthorn and Co.'s establishment in Gateshead. Shortly after he was out of his time he went to the South Shields Gas Company, and was under Mr. W. J. Warner, the engineer. He was first in the City Guilds examination in gas manufacture in 1881. In the same year he was employed by Messrs. J. W. Swan and Co. to organise their lamp factory in Paris. He then went to America to do the same for the Brush people, who had bought Mr. Swan's American patents. On his return to England he was engaged in working out the glow lamp known by his name, and in making an exhaustive series of experiments in secondary batteries for Mr. Norman Cookson. Mr. Swinburne was manager of the Hammond Company's incandescent department, and has been scientific manager to Messrs. Crompton and Co. He now practises as a consulting engineer, and is a director of Swinburne and Co., Limited, of Teddington. He has published a small book on "Electrical Units," and another on "Electrical Measurement," and is an occasional contributor to *The Electrician* and other technical journals. He is a member of various scientific societies. He experimented on compound-winding, and had the first compound machines ever constructed made to his order in the spring of 1882. He is the inventor of several improvements connected with incandescent lamps, such as the system of butt-joint mounting now commonly used. His inventions include an electric governor ; compensation of voltmeters for temperature errors by means of wires of different temperature co-

Digitized by Google

efficients; a Wheatstone bridge compensated for temperature; some forms of mercury pumps; the form of dynamo with small field-magnets and a hole-wound armature; an induction apparatus for determining the constants of a dynamo accurately before it is built; compound-wound direct-current transformers; an alternating motor; the form of open circuit transformer known as the "Hedgehog." He has also written Papers on secondary batteries, dynamos, and motors, transformers, safety devices, control and coupling of central station dynamos, testing dynamos, &c. The method of testing the efficiency of a dynamo or motor, used at the Paris Exhibition; the use of sodium sulphate for reducing "irreducible" sulphate of lead; and many smaller inventions, are due to him.

SWINTON, Alan A. Campbell. Born in Scotland in 1863.

Mr. Swinton entered Sir W. G. Armstrong's Elswick works in 1882 as a pupil, and in 1884 succeeded to the position of electrical engineer to the Company, in which capacity he superintended the electric lighting of all the war vessels built at Elswick up to 1887. During this period he introduced the system of wiring ships with lead-coated cable, since adopted by the English Admiralty, and in conjunction with Lord (then Sir William) Armstrong designed and laid down what is, it is believed, the first practical example of the bare copper conduit system of underground mains since so widely used for low tension distribution. In 1887 Mr. Swinton left Newcastle to take up his residence in London, retaining, however, the appointment of electrical adviser to Messrs. Armstrong, which he still holds. Since that date numerous electric installations have been erected under his superintendence. By appointment of the Secretary of State, Mr. Swinton is consulting electrical engineer to the Metropolitan Police, and he is managing director of the Scarborough Electric Supply Company. He has interested himself in telephonic matters, and took some part in the reorganisation of the New Telephone Company for the purpose of improving the London telephone service. Mr. Swinton has written two books on electric lighting—"The Principles and Practice of Electric Lighting," published in 1884; and "The Elementary Principles of Electric Lighting," first published in 1886, which has run to two editions. He exhibited curious photographs of electrical discharges at the 1892 *conversazione* of the Royal Society, and read a Paper on the subject of these photographs at the Edinburgh meeting of the British Association. He also exhibited original electrical experiments at the last two Royal Society *conversazioni*, among others the incandescing of an ordinary glow lamp by means of current passed through the human body. Mr. Swinton is an associate member of the Institution of Civil Engineers, and a member of the Institution of Electrical Engineers.

TESLA, Nikola, was born in Smiljan, a small place on the Austrian border, and is now 36 years of age.

He was educated principally at Carlstadt, Croatia. Returning home in 1873, during the cholera epidemic, he was affected by the disease, and for two years his further studies were temporarily interrupted. During this time, as much as his health permitted, he made experiments, principally in electricity. He then entered the Polytechnic School at Gratz, Austria, with the intention of graduating as a Professor of Mathematics and Physics, but, however, turned his attention to engineering, applying himself during his free hours to the study of electricity. He then entered the engineering department of the telegraph at Budapest, and in 1881 he turned his attention to the electric light and the construction of dynamo machines. The drawbacks of the commutator and brushes appeared to him so great that ever since 1875, when he first operated a Gramme machine, he thought incessantly of doing away with this defect on dynamos and motors. Early in 1882 he went to Paris, where he remained over two years in the service of one of the leading companies, and went in 1884 to America, where he has remained ever since, and where he has brought out a system of arc lighting, a potential regulation of dynamos and motors (which in one modification is now known as the "third Brush regulation"), a thermo-magnetic motor and generator, a double-disc dynamo, and various types of alternate-current motors. More recently he has been engaged in the study of alternating currents of high-tension and high frequency.

THOMPSON, N. G. Born at Ripon, Yorkshire; educated at Christ College, Finchley, and King's College, London; pupil for three years with Messrs. Simpson and Co., hydraulic engineers, London.

Commenced business with Mr. R. E. Crompton in 1878, and superintended the lighting of Mansion House, King's Cross Railway Station, and other important installations. In 1883 Mr. Thompson went to Moscow, where he carried out the lighting of the British Embassy during the coronation of the present Czar. On returning from Moscow Mr. Thompson entered into partnership with Mr. Rew, which partnership was dissolved in 1889.

THOMPSON, Silvanus Phillips. Born at York, June, 19, 1851; educated at the Friends' School, York.

Mr. Thompson subsequently studied at the Founders' College, and in 1869 graduated B.A. of London University. Having, however, a preference for science rather than literature, he studied to qualify himself for the post of science master in his former school at York. This post he abandoned for the sake of further study of chemistry and physics, and pursued courses in these subjects at the Royal School of Mines, supplemented by visits to the University of Heidelberg and other foreign institutions. In 1875 he graduated as Bachelor of Science of the University of London, being bracketed first in Honours; and in 1878 he took the further degree of Doctor of Science, selecting experimental physics as his subject for examination.

Meantime he had been acting as Lecturer in Physics in the then newly-established University College at Bristol, and had also begun to lecture under the Gilchrist Educational Trust. In 1878 he was appointed Professor of Experimental Physics in Bristol University College. In connection with this Chair he, in addition to the usual academical courses of lectures, delivered courses upon the Technical Applications of Electricity, upon Sound in relation to Music, and a special course of technical physics for engineers and builders. He had also the onerous duties not only of lecturing on Experimental and Mathematical Physics in the College, but of organising the Physical Laboratory of the College. From the time that he entered on his duties at Bristol, Prof. Thompson made important contributions to contemporary science. The *Reports* of the Physical Society of London and of the British Association bear witness to his zeal as a physicist, and his insight as an inquirer into physical, and chiefly electrical, phenomena. His investigations range from the chromatic aberration of the eye to the form of coils in the tangent galvanometer. The curious optical illusion, "strobic circles," was his discovery; and his application of the magnetic figures formed with iron filings to the illustration of electro-dynamic relations, and to the elucidation of the action of the dynamo-electric machine, are well known. Prof. Thompson also has the honour of having applied Clerk Maxwell's electromagnetic theory of light to the explanation of the behaviour of tourmaline crystals in their action upon polarised light, and he has even constructed electro-optic models of these crystals out of iron wire and glass. In the course of this investigation, which was largely mathematical as well as physical, he brought out a new proof of the fact—still not quite regarded by some physicists as settled—that the displacements in a wave of light are perpendicular to the so-called plane of polarisation. Prof. Thompson is, however, better known by his work amongst the applications of science than in the more recondite fields of abstract physics. His studies upon electrical storage and upon dynamo-electric machines are known to all electricians, and have received the recognition of the Society of Arts by the award of two silver medals. His Cantor Lectures on the latter subject, delivered in the autumn of 1883, at once established his reputation of being among the foremost in the special study of the construction, theory, and mode of working of dynamo-electric machines. The lectures then read before the Society of Arts formed the first really practical effort that had been made to examine this subject with anything like clearness and a thorough grasp. The success of Prof. Thompson's "Elementary Lessons in Electricity and Magnetism" has been remarkable, 40,000 copies having been printed in eight years in the English language, besides French, German, Italian, and Polish editions. In 1884 Prof. Thompson published his treatise on "Dynamo-Electric Machinery," which has run to four editions, and has been translated into French and German. He has also published several other works, including a biographical notice of Philip Reis—whose invention in the years 1860 to 1863 of the telephone that bears his name had been almost lost sight of in the fame of later improvements—a study of Apprenticeship Schools in France, and several pamphlets on Technical and Scientific Education.

Prof. Thompson's electrical library is second only to Mr. L. Clark's. When Prof. Ayrton was elected to the Chair of Physics at the Central Institute at Kensington, Prof. Thompson was elected to fill the vacancy at the City and Guilds Technical College, Finsbury, where his energy has increased and expanded the work of the classes with great success. He is also Principal of the Technical College. Besides discharging the ordinary duties of his appointment, Prof. Thompson has found time to continue his contributions to science pure and applied. In 1887 he communicated to the Society of Telegraph-Engineers and Electricians a Paper on his Telephonic Investigations, and in 1888 another on the Influence Machine. To the *Proceedings* of the Physical Society, of which he is a vice-president, he has contributed a number of Papers on Physical Optics and on Geometrical Optics. To the Society of Arts he has given two bibliographical Papers: one on the Development of the Mercurial Air Pump, and another on the Mechanism of Arc Lamps, both of which are replete with information. For the same society early in 1890 he delivered a series of Cantor Lectures on the Electromagnet, the outcome of six or seven years of work. His address on Electromagnetic Mechanisms, delivered as President of the Junior Engineering Society, is a continuation of the same topic. His book, "The Electromagnet," which is now in the second edition, and has been translated into French, German and Russian, is a greatly enlarged reprint of these lectures. He has also published in a pamphlet his lecture on "Electricity in Mining," which formed the topic of his 1891 lecture at the British Association. Prof. Thompson took the leading part in the founding of the Gilbert Club, and is actively aiding in the forthcoming translation of "De Magnete." In pursuance of the objects of this club, he has repeatedly lectured on the life and work of Dr. Gilbert. He is a Fellow of the Royal Society and of the Royal Astronomical Society, was one of the honorary vice-presidents of the Electrical Exhibition at Frankfort in 1891, and one of the British delegates to the Electrical Congress of Chicago in 1893, where he read a Paper on Ocean Telephony, in which he propounded the idea of accelerating the speed of signalling in cables by the use of inductive shunts at intervals along the cable.

THOMSON, Elihu. Born in Manchester, England, in 1853, of Scotch and English parentage.

At the age of five Elihu Thomson went with his parents to Philadelphia, U.S.A., where they settled. He was educated in the public schools of Philadelphia, and graduated at the Central High School in 1870. While at school he excelled in science and mathematics.

Digitized by Google

During most of his school period he constructed and experimented with machines and apparatus of various kinds made with the crudest tools. He constructed when eleven years of age a successful frictional electric machine from a description, never having seen such apparatus. This was soon followed by voltaic batteries, telegraph instruments, Holtz machines, &c. Experiments in chemistry were taken up about the same time, and books on the subject diligently studied. As part of this he became interested in amateur photography at twelve, an interest which is still retained. After graduation at seventeen, he spent six months as analyst in a laboratory in Philadelphia, and first lectured in public about this time. He was then appointed Assistant Professor of Chemistry and Physics in the Central High School in the fall of 1870, having charge of the chemical laboratory. This position he filled until promoted to the chair of Professor of Chemistry and Mechanics in the same institution in 1875. During the period between 1870-6 he pursued his amateur work, and built a pipe organ of several stops with electro-pneumatic action of his own design, making pipes, keys, soundboard, &c. Among other things he constructed several compound achromatic microscopes, doing the lens work and brass work. One objective made contained ten lenses in the combination. He also experimented with arc lights from batteries, induction of currents, &c., which led him to construct much electrical apparatus. He lectured frequently on scientific topics, and had charge of the department of chemistry in the Artisans' Night School of Philadelphia. He was appointed lecturer on electricity at the Franklin Institute in 1877, and worked on its committees, notably the committee on dynamo-electric machines, the report of which was published in 1878. He had been at work on dynamo machines and electric lighting from 1874, and later associated with himself in such work Prof. Edwin J. Houston, his colleague for a short period. Several joint patents were taken out with Prof. Houston, notably the three-coil armature and regulation of current by the shifting of the commutator brushes. Upon these and other inventions the American Electric Company, afterwards the Thomson-Houston Electric Company, was organised in 1880, and Prof. Thomson became its electrician, resigned his professorship at the Central High School, and removed from Philadelphia to New Britain, Connecticut, where the works were first established. Prof. Houston, not being actively associated with the company at any time, remained in his professorship at the Central High School, which is still retained by him, and his association with Prof. Thomson in scientific work and invention ceased in 1880. Prof. Thomson, besides attending to the designing and manufacture of the well-known electrical apparatus of the Thomson-Houston Company, has taken out several hundred electrical patents in the United States for inventions, many of which have gone into extensive use. The work has covered the widest range of electrical engineering, and has necessitated thousands of experiments and resulted in the accumulation of a great number of first models, which are carefully preserved. The training which his early work of devising substitutes for expensive apparatus involved, the mechanical skill acquired, and the scientific and technical information at command have combined to secure successful invention and development. Prof. Thomson is also the originator of the electric welding and metal working processes which bear his name, the developments of which have necessitated a vast additional amount of study in new lines. He has been a frequent contributor by Papers and correspondence to the electrical and technical journals, and to societies, of many of which he is a member. His discoveries in connection with the actions of alternating currents, in the application of which currents he was a pioneer, are particularly noticeable. He served as President of the American Institute of Electrical Engineers in 1889. In recognition of his electrical work he was decorated Officer of the Legion of Honour at Paris in 1889, in addition being awarded the Grand Prix at the Paris Exhibition for the apparatus he exhibited illustrating his inventions. In 1890 the honorary degree of Master of Arts was conferred on him by Yale University. Prof. Thomson experimented early in 1879 with closed iron circuit transformers in multiple with reduction of potential; was the first to employ a field-exciting coil around the armature of a dynamo, giving rise to the first "iron-clad" type; originated the air blast applied to switches and commutators; first applied arc rupturing devices to lightning arresters and switches; designed and applied electromagnets with uniform attraction of armature to various constructions such as arc lamps and regulators; originated the grounded sheath between primary and secondary of transformers, and applied the grounded secondary of his invention. He invented the static or film cut-out or shunting device, closing itself through a layer of highly resisting material, the vacuum cut-out in which a vacuous space is used as the resisting layer, invented and applied variable reactive coils for controlling alternating currents, and used them for the first time as substitutes in a circuit for lamps instead of using resistances. He invented and applied the counter-distorting or inclined series coil over the armatures of dynamos, shunting devices for series incandescent lamps, the compensating or energy transferring system, in which a reactive coil or transformer is used in a three-wire system or the like for balancing the consumption on the two sides. He originated the type of motor for alternating currents called the "transformer motor," and applied the principle of inductive repulsion discovered by him to indicators, arc lamps, regulators, &c. He invented the evaporation meter, and applied the principle to other devices. In addition to work in electric welding, he has of late been most actively engaged in the development of the railway work of the Thomson-Houston Electric Company along with his work in electric lighting and power. The Paris

Digitized by Google

Commission of 1890 for examination of electric meters divided the first prize between the Aron meter and the Thomson meter, as both instruments fulfilled the conditions of the award.

THOMSON, J. J., M.A., Hon. Sc.D. (Dublin), F.R.S. Born in 1856, at Cheetham Hill, near Manchester.

Student for five years at the Owens College, Manchester, of which he is an Associate. While at the Owens College he worked in the Physical Laboratory under the late Prof. Balfour Stewart. In 1876 he entered Trinity College Cambridge, as a Minor Scholar; he was elected to a Major Scholarship in 1878, to the Sheepshanks Astronomical Exhibition in 1879, and took his degree as second wrangler and second Smith's Prizeman in 1880. He was elected a Fellow of his College in 1880, and appointed Mathematical Lecturer in 1882. In this year he gained the Adams Prize for an essay on the Motion of Vortex Rings. In 1884 he was elected a Fellow of the Royal Society, and in the same year he succeeded Lord Rayleigh as Cavendish Professor of Experimental Physics in the University of Cambridge. He is the author of numerous Papers, and of a "Treatise on the Motion of Vortex Rings," "The Application of Dynamics to Physics and Chemistry," and "Recent Researches on Electricity and Magnetism." He is a Fellow of the Mathematical Society, and Vice-President of the Cambridge Philosophical Society.

TOMLINSON, Herbert, B.A., F.R.S.

Mr. Tomlinson was educated at St. Peter's School, York, and at Christ Church, Oxford, where he gained an open mathematical studentship. In 1868 he graduated as B.A. both in the Mathematical and Natural Science Honours' Schools; in 1870 he was elected one of the Whitworth Exhibitioners of the University of Oxford; and in the same year was appointed Demonstrator and Lecturer on Natural Philosophy at King's College, London, which post he still retains. In 1889 he was elected a Fellow of the Royal Society, in consideration of his original researches in physics. As a writer on physics Mr. Tomlinson is well known through his numerous contributions to the *Transactions* and *Proceedings* of the Royal Society, the *Philosophical Magazine* &c., the most important of which relate to the effects of mechanical stress on the electrical, magnetic, and other physical properties of metals. The following Papers may be enumerated:—"Effect of Magnetisation on the Electrical Conductivity of Iron" (1875); "Increase in Resistance to the Passage of an Electric Current produced in certain Wires by Stretching" (1877); "Alteration of Thermal Conductivity of Iron and Steel caused by Magnetism" (1878); "Moduli of Elasticity," and "Electrical Conductivity" (1883); "Note on Hall's Phenomenon" (1884); "Relations between Moduli of Elasticity, Thermal Capacity, and other Physical Constants;" "Alteration of the Electrical Conductivity of Cobalt, &c., by Longitudinal Traction," and "On Certain Sources of Error in Connection with Torsional Vibration" (1885); "The Effect of Pressure on the Electrical Resistance of Carbon," "The Coefficient of Viscosity of Air," "The Internal Friction of Metals," "The Effect of Change of Temperature on the Internal Friction and Torsional Elasticity of Metals," and "Temporary and Permanent Effects Produced on Some of the Physical Properties of Iron by Raising the Temperature to 100°C." (1886); "The Velocity of Sound in Metals, &c.," "Magnetic Induction," "The Effect of Change of Temperature in Twisting or Untwisting Wires which have Suffered Permanent Torsion," "Remarkable Effect of Raising Iron when under Temporary Stress or Permanent Strain to a Bright-Red Heat," and "The Effect of Magnetisation on the Thermo-Electrical and other Physical Properties of Bismuth" (1887); "The Effect of Magnetisation on the Elasticity and Internal Friction of Metals," "The Effect Produced on the Thermo-Electrical Properties of Iron when under Stress or Strain by Raising the Temperature to the Bright-Red," "The Recalescence of Iron," "Temperature at which Nickel begins to suddenly Lose its Magnetic Properties," "The Thermo-Magnetic Properties of Iron and Nickel" (*The Electrician*), and "A Theory concerning the Sudden Loss of the Magnetic Properties of Iron and Nickel at certain Temperatures" (1888); "The Effect of Repeated Heating and Cooling on the Electrical Resistance of Iron," and "The Internal Friction of Iron, Nickel, and Cobalt, studied by means of Magnetic Cycles of very minute range" (1889).

TOMMASI, Donato. Born at Naples, December 22, 1848.

Dr. Tommasi has done good work as a chemist and electrician. He is a contributor to the scientific press, and a member of numerous learned societies, amongst which are the Chemical Societies of London, Paris, Brussels, and Edinburgh, the Société de Physique, the Société Electrotechnique de France, the Société Internationale des Electriciens, &c., &c. His contributions to various scientific journals are both voluminous and valuable. The following is a list of the most interesting Papers:—"Sur un Nouveau Système de Télégraphie Pneumatique;" "Sur une Nouvelle Source de Magnetisme;" "Action du Froid sur l'Arc Voltaïque;" "Sur l'Electrolyse de l'Eau;" "On the Reduction of Chloride of Gold by Hydrogen in the Presence of Platinum;" "Sur le Travail Chimique produite par la Pile;" "Influence de l'Electrode Positive de la Pile sur son Travail Chimique;" "Sur l'Electrolyse de l'Eau Distillé;" "Sur l'Électrolyse;" "Relation entre la Force Electromotrice de la Pile et les Calories de Décomposition de l'Eau;" "Sur l'Emploi des Couples en Charbon dans l'Electrolyse;" "Chaleur due à l'Aimantation;" "Sur l'Electrolyse de l'Acide Chlorhydrique;" "Conservation de l'Energie Solaire;" "Sur un Nouvel Accumulateur à l'Électrodes en Charbon Plombifère;" "Equivalents Electro-Chimiques;" "Régulateur photo-électrique à Sélénium;" "Eclairage des Trains de Chemin-de-Fer par l'Electricité combinée avec le Gaz;" "Chauffage des Trains de Chemin-de-Fer par l'Electricité;" "Pile à Electrodes de Charbon;" "Liquefaction des Gaz;" "Nouveau Système de Transmission

Digitized by Google

Téléphonique et Télégraphique ;" "Relais différentiel pour Téléphones et Télégraphes ;" "Des diverses Causes de Dégagement d'Electricité ;" "Dispositif de Transmission Multiplex pour Communications Téléphoniques ;" "Nouvelles Cartouches de Mine ;" "Accumulateur Multitubulaire ;" "Lampe Électrique de Sûreté pour les Mines ;" "Electrolyseur pour l'Extraction, la Séparation et l'Affinage des Métaux." Dr. Tommasi has also published the following works :—"Traité Théorique et Pratique d'Electrochimie ;" "Traité des Piles et des Accumulateurs Electriques ;" "Traité de Galvanoplastie."

TROUTON, Frederick Thomas, M.A., D.Sc. Born in Dublin, November 23, 1863 ; educated at the Royal School, Dungannon, and Trinity College, Dublin.

Mr. Trouton graduated B.A. in 1884, obtaining the large gold medal in Chemistry and Physics ; in the following year he took his degree in the Engineering School, Trinity College. In 1884 he was appointed assistant to the Professor of Physics in the University of Dublin. Mr. Trouton is the author of Papers on various subjects, including "The Temporary Thermocurrents in Iron," "The Rate of Propagation of Induced Magnetisation in Iron." He undertook in 1885, at the instigation of Prof. Fitzgerald, for the British Association Committee on Electrolysis, investigations with the view of verification of Ohm's law in electrolytes, a work extending over two years. Since 1889 Mr. Trouton has contributed to *Nature* and elsewhere accounts of the repetition of many of Prof. Hertz's experiments with electromagnetic radiation, and in addition of experiments devised to illustrate the identity of electromagnetic radiation with light made in imitation of well-known optical experiments, such as interference in thin plates, diffraction, and polarised reflection from non-conductors, by the latter of which it was possible to decide experimentally on the direction of vibration in polarised light.

TROUVÉ, Gustave. Born at Lahaye, Descartes, France, January 1, 1839.

M. Trouvé is a scientific instrument maker, engineer, and constructor, patented Lauréat de la Faculté de Médecine de Paris, Membre Lauréat de l'Académie Nationale Agricole, Manufacturière et Commerciale, de l'Association Française pour l'Avancement des Sciences, and de la Société d'Encouragement pour l'Industrie Nationale, Chevalier de la Légion d'Honneur. During his early years M. Trouvé manifested a decided predilection for the applied sciences, and studied with great assiduity, his only amusement being the construction of various kinds of miniature telegraphic apparatus. At the age of seven years he contrived and finished a steam engine, which, despite its Liliputian proportions, worked with precision. In the Collége de Chinon, where he commenced his actual studies, M. Trouvé displayed an especial aptitude for the mathematical and mechanical sciences, and when he had passed through a course of instruction at the establishment we have named, he quitted his native town for the purpose of entering l'Ecole des Arts et Métiers d'Angers ; and afterwards went, at the age of twenty, to Paris, in order that he might further perfect himself. In 1866 M. Trouvé established his workshop for the manufacture of instruments of precision, and soon entered into relations with the principal physicians of Paris, for one of whom he designed and executed, in three days, the instrument known as "explorateur-extracteur-électrique," a contrivance for localising and facilitating the extraction of projectiles from the human body. He has obtained for his apparatus honourable mention at the Paris Exhibition of 1867 ; silver medal of the Société d'Encouragement in 1870 ; Progress medal at the Exhibition of Vienna, 1873 ; gold medal at the Académie Nationale, 1875 ; Barbier prize of the Faculté de Médecine in 1875 ; gold medal at the Universal Exhibitions of Paris, 1878 and 1889 ; six diplômes d'honneur at the Académie Nationale, 1877, 1879, 1885, 1891-1892, and at the Antwerp Exhibition in 1891 ; and the Melsen Prize in 1893 ; independently of many other gold and silver medals which he has at different times been awarded for home and foreign exhibits. The inventions and other works of M. Trouvé are almost innumerable ; among the principal of them, however, may be mentioned "the double movement electro-spherical motor," which demonstrated the law of Newton that the action is equal to the reaction, and the force to the resistance, and which is employed at the present time to demonstrate the reactions in Prof. Crookes's radiometer ; the reversible hermetic battery (1865), presented to the Académie des Sciences in December, 1867, by the late M. Becquerel ; the electric gyroscope (1865) ; the electric gun (August 9, 1866) ; the electro-medical pocket case, presented to the Académie des Sciences (1867) ; apparatus for experimentally and immediately determining the best angle of inclination of a screw for any given force (1867) ; military portable telegraph, presented by the late M. du Moncel to the Société d'Encouragement in 1872 ; a constant and continuous cell, said by Trouvé to be more constant than the Daniell—which was presented by M. Becquerel to the Académie des Sciences in 1873, and to the Académie de Médecine by M. Gavarret in 1874 ; a dynamo-electric or magneto-electric machine (1875) ; an electro-magnetic apparatus registering the number of its alternations—which placed in evidence the mode of muscular contraction—presented to the Académie des Sciences (1877) ; a new electric reversible motor (1880) ; application of electric motors to pleasure boats (1881) ; an electric tricycle, travelling 15 kilometres (9·32 miles) per hour (1881) ; application of the Trouvé electric motors to balloons (1881) ; practical solution of domestic electric lighting (1883) ; the Trouvé-Helot electric photophore (Académie des Sciences, April 16, 1883) ; the Trouvé universal electric safety lamp (1884) ; an electric guidon and electric projector for shooting during the night (Académie des Sciences, July 7, 1885) ; electric apparatus for the lighting of physiological, botanical, chemical, micrograph, &c., laboratories (presented by M. de Lacaze-Duthiers to the Académie des Sciences August 3, 1885, and

Digitized by Google

by M. Gariel to the Académie de Médecine, March 2, 1886); a new mode of constructing screws for ships (Académie des Sciences, July 12, 1886); an electric siren, a signal of alarm for boats, canoes, &c. (July 12, 1886); Trouvé's electric "Helicoptère" and "Aeroplane," rising in the air by means of an exceedingly light motor provided with an atmospheric screw and worked by an electric current; a new "Interrupter Commutator," suppressing the rupture spark in electric currents of great intensity; Trouvé's electric "Auxanoscope," for the projection of opaque or transparent objects (Scientific Congress of Toulouse, September 26 and 28, 1887); Trouvé's electric fraiseuse for dentists' use (April 26, 1888); Trouvé's "Universal Dynamometer," with "teletachometer," for long-distance multiple and simultaneous indications (Nov., 1888); a universal meter for measuring electricity in any form; Ascanio lights (Paris Opera, April, 1890); hand-worked dynamos for demonstrative purposes (May, 1890); miners' lamp and orygmatoscope (Académie des Sciences, August 18, 1890); electric gyroscope and marine gyroscope (Académie des Sciences, August 25, 1890); Trouvé combined gas and electric lighter; a system of aerial navigation by a heavier medium than air (Académie des Sciences, August 24, 1891); a new system of maritime navigation with sea-water battery (Académie des Sciences, August 31, 1891); Trouvé luminous fountain for table and hall, changing appearance and colour (Académie des Sciences, October 12, 1891); monumental luminous fountain with automatic changeable colours (Académie des Sciences, September 12, 1892); physiological and medical dynamometers, rheostatic balance (1892); and he indicated in his pamphlet, "A New Process of Fishing" (1893), some great improvements in fishing apparatus. M. Trouvé has endowed science with apparatus of incalculable value. Among the most curious and most useful of his inventions is the electric polyscope, which he perfected in 1869; by its means a thorough diagnosis of the diseases of the throat, the ear, the eye, or any hidden part of man's organisation, can easily be made; also the electric explorer for and extractor of projectiles, which has been adopted and placed in military chirurgical pocket cases. M. Trouvé, who is the author of a "Manuel théorique, instrumental et pratique d'Electrologie médicale," was named Chevalier of the Legion of Honour by decree of the President of the Republic on the 29th of December, 1881.

TUNZELMANN, G. W. de. Born in London in 1856; educated at Elizabeth College, Guernsey; after a few years' pupilage in the drawing office of a civil engineer, he matriculated at London University, and entered University College, London, in 1873, where he studied mathematics and physics under Henrici, Clifford, and Carey Foster, and engineering under Kennedy, in addition to other subjects taken up for general culture.

In 1876 Mr. Tunzelmann took the exhibition given by the Clothworkers' Company in Chemistry and Physics at University College, and he then worked in the physical laboratory under Prof. Foster until 1878, working also for a part of the time in Dr. Williamson's chemical laboratory. In 1878 Mr. Tunzelmann read a Paper at the Physical Society, on "The Production of Thermo-Electric Currents by Mechanical Strain," and in the same year he took the scholarship given by Baroness Meyer de Rothschild for pure and applied mathematics at University College. In 1878 he took his degree as B.Sc., London University. From 1876 to 1878 he acted as Dr. Henrici's assistant in mathematics. In 1877 he was elected a member of the London Mathematical Society and of the London Physical Society; in 1890 he became a member of the Institution of Electrical Engineers; and in 1892 he was elected a member of the Société Internationale des Electriciens, Paris, and of the Electro-Technical Society of Berlin. In 1881 he was asked by Prof. Foster to undertake some experimental work he had in hand for the British Association, *i.e.*, testing a method devised by him for obtaining the value of the ohm. The results are embodied in the British Association "Report," and also appeared in *The Electrician* during 1881. In September, 1881, he was appointed instructor in natural philosophy and astronomy on board Her Majesty's ship "Britannia," training ship for cadets, which position he resigned in 1884. In 1882 he was appointed assistant examiner in magnetism and electricity to the Science and Art Department, South Kensington, an appointment which he still holds. He has contributed largely to the scientific and technical journals, including *The Electrician*, *Nature*, *Industries*, *Engineering*, and various foreign journals, and has written numerous popular articles for different periodicals. He is the author of "Electricity in Modern Life," one of the volumes of "The Contemporary Science Series," and he is at present the principal and Professor of Physics and Electrical Engineering in the Electrical and General Engineering College, Earl's Court, London, S.W.

TWEEDDALE, Marquis of, is the tenth marquis, and was born in 1826. He was educated at Haileybury College.

The Marquis of Tweeddale was formerly in the Bengal Civil Service, having been Deputy-Commander of Simla, and Superintendent of Hill States in Northern India. His second title is that of the Earl of Gifford. He sits in the House of Lords as Baron Tweeddale. Sat as M.P. for Taunton in 1865-8, and for the Haddington Burghs in 1878. The Marquis of Tweeddale has interested himself considerably in the promotion of submarine telegraphy, and is chairman of the Anglo-American Telegraph Company, vice-chairman of the Eastern Telegraph Company, a director of the Eastern Extension, Australasia and China Telegraph, and of the Globe Telegraph and Trust Companies, and trustee of the Submarine Cables Trust.

UNWIN, Prof. W. C. Educated at the City of London School.

Digitized by Google

On the completion of his apprenticeship at the works of the late Sir William Fairbairn at Manchester, he was for some years manager of engineering works in Kendal and Manchester. In 1867 he was appointed Instructor in Marine Engineering in the Royal School of Naval Architecture and Marine Engineering, then at Kensington. In 1871 he was appointed Lecturer and Examiner, and in 1872 Professor of Mechanical and Hydraulic Engineering at the Royal Engineering College, Cooper's Hill. In 1884 he was appointed Professor of Engineering at the Central Institution of the City and Guilds Institute for the Promotion of Technical Education, at Kensington, and has been Dean of the Institution since its opening. He is a Fellow of the Royal Society, a member of the Institutions of Civil Engineers and Mechanical Engineers, member of the American Philosophical Society, hon. member of the Franklin Institute, member of the Society of Arts, and honorary associate of the Royal Institute of British Architects. He is the author of various Treatises and Papers in the *Transactions* of scientific societies, amongst which may be mentioned "Wrought Iron Bridges and Roofs" (1869); "The Elements of Machine Design" (of which the 11th edition was published in 1891); "The Testing of Materials of Construction" (1888); Cantor Lectures (1887); Howard Lectures (1893). In 1890 he was appointed Secretary of the International Niagara Commission; and in 1892 he was President of the Mechanical Section of the British Association.

UPPENBORN, F. Born January 29, 1859, at Hanover.

Mr. Uppenborn studied physics and engineering at the Technical High School at Hanover. In 1881 he became editor of the *Centralblatt für Elektrotechnik*, the first journal of applied electricity in Germany. In 1882 and 1883 he was engineer-in-chief of the well-known firm of S. Schuckert, Nurnberg; since 1883 he has had a factory for dynamos at Hanover; and since July, 1886, he has been director of the "Elektrotechnische Versuchs-Station" at Munich, a public electrotechnical laboratory. In January, 1890, he removed to Berlin, where he united the two German journals *Elektrotechnische Zeitschrift* and *Centralblatt für Elektrotechnik*. He has contributed to the theory of dynamos, of transmission of power, and to several methods of measurement.

UPWARD, A. Réné. Born in London in 1861, and mainly educated by private tuition in Lincoln's Inn.

In 1878 Mr. Upward was admitted as a pupil to the Woolwich works of Messrs. Siemens and Co., where within a few months he was made a member of the staff by the late Sir William Siemens. Having passed through the various departments of these large works, Mr. Upward began the study of chemistry, mainly in its relation to metals, under the late Prof. Bloxham, King's College, supplementing this by visits to the coal pits and ironstone mines of the Yorkshire district. In 1882 he revisited the Messrs. Siemens' works at Woolwich, to carry out some experiments on a new Siemens arc lamp and other apparatus. Subsequently he became head electrician to the Woodhouse and Rawson Electric Manufacturing Company, Limited, which position he held for five years, during the most active time of the electric lighting development. From time to time during this period Mr. Upward also conducted a long series of experiments and tests on secondary batteries, new types of electrical measuring instruments, electrochemical processes, &c., also devising for this Company special methods for rapid and accurate tests, determination of constants, exact calibration of instruments, and other special means and devices for accurate electrical measurements adapted to the requirements of an unusually large factory where nearly every description of electrical work was undertaken. After his connection with this Company he acted for and advised the Wenham Light Company, Limited, and the House-to-House Electric Light Company, Limited, together with other well-known undertakings. Mr. Upward is well known as the inventor of the gas battery bearing his name, an account of which first appeared in *The Times* in July, 1886. The electrolytic action of the "Upward chlorine cell" is now well known and has been minutely and critically examined and exhaustively reported upon by Dr. Oliver J. Lodge, whose report was published in the electrical press at the time. Shortly after bringing out this invention, Mr. Upward communicated a Paper to the British Association meeting of 1886. Mr. Upward is the author of inventions apart from electrical science, notably researches on liquefied gases and their practical application. The late Sir Morell Mackenzie was specially interested in a machine actuated by this form of stored power, designed by Mr. Upward, for giving antiseptic sprays at any required interval night and day continuously, the machine being completely self-acting and capable of working for months without attention or adjustment.

VAN TROMP, Benjamin Humphries. Born at Delft House, Somersetshire, in 1830.

Mr. Van Tromp commenced his professional career in London as a Parliamentary agent in 1860. After a few years he determined, however, to enter the legal profession, and with this object associated himself with Messrs. Johnson, Farquhar, and Leech, with whom he served his articles. These gentlemen were the well-known solicitors for the Great Northern Railway Company from the commencement of that enterprise. Mr. Van Tromp remained associated with this firm until 1869, when he commenced practice on his own account. Mr. Van Tromp is a lineal descendant of the great Dutch Admiral, Cornelius Van Tromp, who was created Earl of Selsburg by the King of Denmark, and a Baronet of the United Kingdom by Charles II. in 1675. Many interesting relics of his ancestors are treasured at his residence in Hyde Park-terrace. His first introduction to the world of electricity was as solicitor for the

Digitized by Google

London and Provincial Telegraph Company, originally called the London District Telegraph Company, of which Mr. Charles Curtoys (*see* page XXII.) was the Manager and Secretary. He has practised as a solicitor since 1869, and is now head of the firm of Messrs. Van Tromp and Co., in Essex-street, Strand, but does not take an active part in the conduct of the business, his time being almost entirely absorbed by his position as director of several public companies. Some years ago he accepted a seat at the Board of the Australasian Electric Light, Power, and Storage Company—one of the numerous offshoots of "Father Brush"—and as Chairman of that Company it was chiefly through his exertions, foresight, and tact that arrangements were made with the Brush Electrical Engineering Company, of which Lord Thurlow was then Chairman, whereby the shareholders were saved from the entire loss of the money invested in the Australasian Company, and as a proof of their confidence in him he was unanimously elected to a seat on the Board of the Brush Company. He is also Chairman of the Continental Metropolitan Tramways Company, the owners of the entire system in Paris known as the "Tramways Sud," with a capital of half a million. He is a firm believer in the future of electric traction, and on all occasions has persistently advocated its adoption. He is now, with his colleagues, using every effort to get this motive power introduced on the Paris tramways. Mr. Van Tromp is Chairman of the Brighton Grand Hotel Company, one of the original directors of the Electric and General Investment Company, which Company was formed for the purpose of assisting electrical enterprise, and the formation of companies for the development of all branches of electric work, and Director of the Dover Electric Supply Company.

VARLEY, Frederick Henry. Born in London.

Mr. Varley is the youngest son of the late Cornelius Varley, the members of whose family are more or less identified with electric science. He was educated at a private seminary in Islington, and had the run of his father's studio, laboratory, and workshops, and also accompanied him to the Royal Society, Royal Institution, Society of Arts, Microscopic and other learned societies and scientific meetings, which the late Cornelius Varley zealously attended. In 1859 Mr. Varley joined his father's firm, and aided in the construction of the translating apparatus and polarised relays for the Electric and International Telegraph Company, and the inventions of his brother Cromwell F. Varley, who became engineer-in-chief to that company. Mr. Varley also constructed for his brother rheostats, differential galvanometers and bridges, and continued in similar employment until 1868-9. In 1864 he constructed and adjusted the coils for Sir William Thomson's slides and C. F. Varley's subdividers, being part of the first testing apparatus employed in the continuous ship-to-shore testing. In 1865 he was temporarily employed in testing the Atlantic cable, afterwards rejoining his father's firm. In 1868 he accompanied the Reuter Cable Expedition, and acted as assistant engineer in the laying of that cable from Lowestoft to Norderney. In 1869 he took out his first patents for improvements in testing apparatus. Together with his late brother, Octavius Varley, he started in business as manufacturing and consulting electrical engineers, when they continued making testing apparatus for various important firms. Mr. F. H. Varley is the patentee of improvements in ink-writing Morse instruments in use in Australia, and of a railway block system employed in North Britain, and as a contractor has erected telegraph lines both in the North and South of England. In 1881, in conjunction with his late brother, Cromwell Fleetwood Varley, he invented and patented improvements in cymaphens, or apparatus for the transmission of undulatory currents; also improvements in electric arc lamps. At the same time Mr. F. H. Varley perfected his process for the manufacture of flexible carbons, which he patented in 1882. Mr. Varley found that a current of 400 watts, capable of maintaining an arc between hard carbon poles not more than ¼in. apart, would produce with flexible carbon electrodes an arc from 2in. to 3in. in length. Mr. Varley also employed flexible carbon in plates, sheet, and cord for making rheostats, variable resistances, and for other purposes. He has invented a lamp for burning the flexible carbon, patented the use of this material as a filtering septum, constructed primary and secondary batteries, and likewise has produced a filament for incandescent lamps which is a compound of boron and carbon.

VARLEY, S. Alfred. Born in London, March 2, 1832; is the third son of the late Mr. Cornelius Varley, an active scientist and artist, and one of the founders of the Old Water Colour Society, now the Royal Institute.

Mr. Varley at an early age used to accompany his father on Sundays to a little chapel, the leading Elder of which was Michael Faraday, to whom he was taught to look up in the two-fold capacity of religious teacher and scientific exemplar. At the age of 14 Mr. Varley commenced to study chemistry, and attended every scientific lecture he could obtain access to. In 1849, when electric illumination was being publicly advocated by Staite, Mr. Varley, in conjunction with his elder brothers, made numerous experiments, constructing with his own hands some hundreds of battery cells, but the troublesome manipulation attendant on their use caused him to turn his attention to magnetism. On the completion of his experiments in magnetism, Mr. Varley designed and commenced making a machine whose leading features were constructing the field-magnets of bundles of tempered steel wires, and wrapping the central portion of the revolving armatures with insulated wire, instead of the extremities only, as was the case with the Sexton machine. Chiefly from not having the command of engineering tools the machine was only partly made, and never completed. In 1852 Mr. Varley entered the service of the Electric Telegraph Company, and assisted

Digitized by Google

in some experiments on the retardation of electric signals through underground and submarine circuits, which led to the development of C. F. Varley's double-current system. In 1854 Mr. Varley was appointed to the charge of the telegraphs of the Liverpool district. About this time he constructed an electric chronograph to measure the small intervals of time occupied by the passage of the electric signal to time balls and the time lost in the discharging apparatus. He also made the time ball to automatically record the fact of its having been discharged, so that the station from whence the signal emanated could see that the apparatus had acted properly. The improvements he effected at this period led subsequently to Mr. Varley being entrusted with designing time-ball apparatus for the Cape, India, China, and other places. In the spring of 1855 Mr. Varley was appointed to the charge of the first field telegraphs used in war, and proceeded to the Crimea. After the fall of Sebastopol he took charge of the submarine telegraph connecting Constantinople and Varna. In 1858, when the Atlantic cable was being constructed, he wrote a Paper read before the Institution of Civil Engineers "On the Electrical Qualifications Requisite in Long Submarine Cables," and was shortly afterwards elected an associate member of that institution. In the Paper above referred to, Mr. Varley opposed the views of the electrical advisers of the Company. Faraday, who had publicly supported the views of the scientific advisers of the Company, endorsed Mr. Varley's views immediately after receiving a copy of his Paper. Mr. Varley followed up his first Paper by reading a second one before the Society of Arts, in 1859, "On the Practical Bearing of the Theory of Electricity to Long Submarine Telegraphy." In this Paper, among other things, he suggested the use of artificial lines, which have since proved of such value in connection with duplex working, and described in detail one he was at that time constructing. In 1866 Mr. Varley discovered the reaction principle, and constructed the first machine of the pure dynamo type. This machine is now in the Museum at South Kensington, and for having designed the first self-exciting dynamo Mr. Varley was awarded the Gold Medal of the Inventions Exhibition of 1885. In 1866 he introduced needle-telegraph coils, in which soft-iron magnetically-induced needles were substituted for tempered steel needles. These induced and consequently undemagnetisable needles have entirely superseded the older form introduced by Wheatstone and Cooke, and are largely adopted by the Postal Department as well as for railway telegraphs and signalling instruments. In the same year (1866) he designed a system of electric train inter-communication. In 1876 Mr. Varley patented a series-shunt or compound-wound dynamo, which came under the purview of the Scotch Law Courts in the suit of Messrs. King, Brown and Co. *v.* The Anglo-American Brush Corporation; and Mr. Varley's claim to have first described a system of compound-winding was fully sustained in the Outer House of the Court of Session, Edinburgh (June 27, 1889), on appeal to the First Division of the Court (July 16, 1890), and on the further appeal of the Anglo-Brush Corporation to the House of Lords, judgment was given (April 5, 1892) in Mr. Varley's favour without their lordships hearing defendants' counsel.

Mr. S. A. Varley has from time to time contributed Papers read at the meetings of the British Association, among which may be mentioned one "On the Mode of Action of Lightning on Telegraph Circuits," in which he demonstrated that it was the secondary current developed in the telegraph wire after the lightning discharge, and not the lightning discharge itself, which frequently burnt up the instruments when they were protected by a lightning conductor, and he described a lightning bridge designed by himself which opposed a decreasing resistance to an increasing electric potential. A number of these bridges are still doing duty after more than twenty years' use.

VOLK, Magnus, A.I.E.E., M.S.A. Born at Brighton, October 19, 1851. Educated at private schools.

Mr. Volk was first interested in electricity owing to the description of the single-needle instrument in a prize book gained at school, and he devoted all his spare time to the construction of electrical instruments and models worked by steam. On the death of his father, and when only 15 years of age, he was thrown upon his own resources for a livelihood. Various electric toys were experimented upon, and a model single-needle telegraph was constructed. This proved a great success. In a short time about 60,000 were sold, a large number of hands being employed in their manufacture. About this time he wrote various articles in the *English Mechanic*, which brought him under the notice of Captain Harvey, then experimenting with his towing torpedo. Mr. Volk constructed various apparatus for him, which led to his introduction to Messrs. Vavasseur and Co., for whom, under Captain M'Evoy, he constructed considerable quantities of torpedo apparatus, upon which he was employed for some three or four years. He was next engaged in converting the Martini-Henri rifle into a magazine gun, and had just completed the first apparatus when a sudden and nearly fatal illness caused the loss of the business, and necessitated a fresh start. An opportunity occurred upon the development of the telephone business, and he was then employed by the United Telephone Company to remodel and design various apparatus, also to develop the business in the Brighton district. During this time he experimented in electric lighting, dynamo construction, &c., with such success that the corporation placed the electric lighting of the Royal Pavilion in his hands, an installation numbering about 1,100 lamps. The electrical transmission of power next claimed his attention, and to procure sufficient scope for experimenting, application was made to the Council to grant the use of a strip of ground under the sea-wall to lay an experimental line, which was granted. The first installation consisted of a two horse-power gas engine, a

Digitized by Google

Siemens SD5 dynamo as generator, and an experimental dynamo as motor, fitted into an open car seating ten or twelve persons. The track was about 400 yards long. In a few weeks over 30,000 persons patronised the venture. Application was then made to extend it along the front, but was refused, though permission was afterwards granted as far as the eastward extension was concerned. This railway, which is worked on the third-rail system, has been in existence eleven years, and is patronised during the summer months to its fullest capacity. Mr. Volk gained the gold medal at the Brighton Scientific Exhibition and Health Congress in 1881.

Mr. Volk has contributed several series of articles to *The Electrician*, among which may be mentioned those on Telephony and on Electric Bells. A notice of his electric dog-cart in a German paper brought him under the notice of H.M. the Sultan of Turkey, who invited him to Constantinople, and gave him a special decoration for applied science, and entrusted him on his return with important commissions. In conjunction with others he obtained an Act of Parliament during the last Session for constructing an electric railway along the seashore between Brighton and Rottingdean, which is now being constructed, and which will, when finished, form a unique addition to our electric railways.

VYLE, Samuel. Born at Hatch-Beauchamp, near Taunton, Somersetshire, in 1842. Educated at various country schools in Somersetshire, and the Wesleyan Training College, Bristol.

In 1860 Mr. Vyle entered the Bristol office of the Electric and International Telegraph Company as learner, and shortly after his appointment there he was removed to Swindon, one of the principal testing stations between Bristol and London. Manifesting an interest in the work, Mr. Culley advanced him to Reading, which he left in 1864 for Edinburgh, but on the engineering staff. During his stay in Scotland he extended the wires from Drem to North Berwick, where Lord John Russell was staying at that time. When the news of the somewhat sudden death of Lord Palmerston became known, Mr. Vyle, by special request, sent and received a number of State telegrams for the Earl. The climate being too severe, he was obliged to go South again, and in 1865 Mr. Vyle was busy renewing the lines between Bath and Weymouth, damaged by the great snowstorm the year before. Subsequently he spent about eighteen months in the District Superintendent's office at Bristol, leaving it for the relay station at Haverfordwest, where he remained till shortly after the transfer of the telegraphs to the Government in 1870. Being a skilled shorthand writer, Mr. Vyle's services were sought by Mr. W. H. Preece to assist him in the heavy correspondence consequent upon the many extensions and alterations then demanded. He volunteered for service during the strike in Ireland, and was sent to Cork. Shortly after his return he went a second time to Scotland, but with headquarters at Glasgow. His section extended from Carlisle to Perth, as also the Trossachs and Helensbro'. He rebuilt the road-line Glasgow to Falkirk, and laid new underground wires at Helensbro' during his stay. He also had the honour of running a special wire for the use of Her Majesty between Fort William and Inverlochie Castle—at the foot of Ben Nevis—under circumstances of considerable stress and difficulty. By working through the whole night, the leading-in wire was entrenched below the carriage drive just three hours before the Royal carriages passed over it. In 1877 Mr. Vyle was permitted to return to England, with Middlesboro' as the headquarters of the Cleveland district. Telephones having come into use, he there carried out a series of experiments for the engineer-in-chief, Mr. Graves. Having rendered special assistance to Messrs. Hammond and Co., after the Town Jubilee Exhibition of the Electric Light, Mr. Vyle was induced to accept the appointment of electrician to that firm, thus severing his connection with the Postal Telegraph Department after a service of 21 years. Engaged with electric lighting and telephonic work in Yorkshire and other provincial centres, he came to London in 1882, and during the two following years was engaged with electric light and telephonic work. In 1884 he joined the Telegraph Department of the Caledonian Railway Company, and for the third time went to Scotland. He carried out two electric light installations there, viz., the lighting of the Grangemouth Docks and the Central Station, Glasgow—then the largest railway station installation known. He was also instrumental in duplexing the Glasgow - Carlisle single - needle circuit for the Railway Company. In November, 1887, Mr. Vyle was appointed by the Secretary of State to the post he now occupies, viz., that of electrician to the Post Office, British Guiana. The small telephone exchange, with Ader instruments, which he found in use on taking charge, was, in August, 1890, replaced by a 200 wire multiple switchboard, and Bell and Blake instruments. Early in June, 1892, Mr. Vyle was enabled to put the town of Bartica (the Gate of the Gold Fields) in telegraphic communication with Georgetown. Bartica is 40 miles up the Essequibo River, the banks of which are so thickly covered with brush as to make a land line impracticable. The connection is made by means of a cable running in the bed of the river. The instruments on the circuit are D.C. Duplex Morse, and the line is now one of the best paying in the colony. Mr. Vyle has written a few technical papers one of which was read before the British Association at York in 1881; and he has repeatedly lectured, with acceptance, both in England and Demerara. In 1880 he invented a new form of lightning conductor which could be easily tested, and his efforts at magneto working of telegraph lines have met with success in a dual working instrument, based on the principle of the reversibility of the dynamo. It has worked well over long lines and high resistances, and it is hoped it will replace the present permanent current working of the telegraphs of the Colony.

WALKER, Sydney F. Born February 2, 1852; was educated at Christ's Hospital, Newgate-street, E.C., and Hertford, where he was fortunate enough to secure all the prizes in the Mathematical School, including the Bluecoat Boys' great Vidal prize.

Mr. Walker left Christ's Hospital at Christmas, 1865, being head of the Mathematical School then, and passed into H.M.S. "Britannia," training ship for naval cadets. In the training ship he was fortunate enough to gain first of the first-class for seamanship. Subsequently he served in Her Majesty's Navy at various stations, but was eventually allowed to retire on favourable terms. Being free to follow more congenial pursuits, he, after studying for a time in telegraph schools, obtained a probationary appointment on the staff of Sir W. Thomson and Prof. Fleeming Jenkin at Hooper's Telegraph Works, at Millwall, and later in the same year had sole charge of the core-testing at Mitcham. At the latter part of the same year Mr. Walker, in common with many others, was paid off, and was appointed by the Gramme Magneto-Electric Company their electrician. After about fifteen months, however, the Company being hopelessly involved in litigation, he was allowed to resign his appointment, and purchased a small connection that was advertised for sale at Nottingham, and has since gradually succeeded in establishing one of the largest connections among mines in the kingdom. In 1882 Mr. Walker entered into partnership with Mr. F. G. Olliver.

Mr. Walker is a member of the Inst. of Mechanical Engineers; Assoc. M.I.C.E.; member of the North of England Institute of Mining and Mechanical Engineers, of the South Wales Institute of Engineers, and of the Mining Institute of Cornwall; was elected one of the original Fellows of the Imperial Institute; and has been awarded two silver medals from the Mining Institute of Cornwall for electric signals for mines. The firm have also had large experience in the electric lighting of mines, and have applied telephonic communication to the mines and some of the principal buildings in their district. They also hold many patents having relation to electric lighting; and Mr. Walker has recently patented a simple automatic cut-out (electromagnetic) for electric light and power circuits. Mr. Walker is a frequent contributor to technical literature.

In August, 1889, Mr. Olliver retired from the firm, leaving Mr. Walker sole proprietor of the business. About the same time Mr. Walker published a practical handbook, entitled "Electricity in Our Homes and Workshops," dealing with the construction and maintenance of electric bells, mining signals, and telephones, and the book was so well liked that a second edition was called for in four months. At the end of 1891 he published "How to Light a Colliery by Electricity," and in the spring of 1892 "Electric Lighting for Marine Engineers," both of which have sold well.

WALMSLEY, Prof. Robert Mullineux, D.Sc. (Lond.), F.R.S.E., M.I.E.E., &c. Born in Liverpool.

Dr. Walmsley was educated first at a private school, and then at Queen's College, Liverpool. After a period spent in mercantile pursuits in Liverpool, he took up more congenial work in science and education. His university career commenced in 1879, when he passed the matriculation examination of the University of London, the intermediate examination in science was passed in 1880, and he graduated Bachelor of Science in 1882. During part of this time he was on the staff of the Royal Naval School at New Cross, in the building now acquired by the Goldsmiths' Company for a technical institute. In 1881 he became assistant to Prof. Perry in his technical lecture and laboratory work at the Horological Institute, and in 1882 this engagement developed into one with Profs. Ayrton and Perry, during the continuance of which he had charge of the testing of their well-known early forms of electrical measuring instruments. When the Finsbury Technical College was opened in February, 1883, Mr. Walmsley was appointed Senior Demonstrator under Prof. Ayrton in the department of Electrical Engineering and Applied Physics, and this position he continued to hold when Prof. Ayrton was appointed Professor at the Central Institution. He graduated Doctor of Science in the University of London in 1886, taking as his diploma subject Electricity and Magnetism, treated both mathematically and experimentally. In November of the same year he was appointed Principal of a new Technical College that was to be founded in Karachi, India, and proceeded to take up his appointment. On reaching India he found that, owing to some error in the instructions, the college had been wrongly described, and was to be, in the first instance, an Arts College, its technical development being in the distant future. At the time, however, a scheme was under consideration for the founding of a large Technical Institute in Bombay, and Dr. Walmsley remained more than a year in India in the hope that substantial work in the form of technical education might be done there. During this year, whilst Principal of the Sind Arts College of the University of Bombay, he was repeatedly consulted by the Government of Bombay on the subject of the development of technical education in the Presidency, and submitted various schemes to Government embodying his ideas on the subject. Eventually, being convinced that the proposed Victoria Jubilee Technical Institute had neither the financial nor moral support necessary to give it the barest chance of success, he returned to England. In May, 1888, he was appointed Senior Mathematical Lecturer and Demonstrator under Prof. Henrici at the Central Institution, and held this appointment till September, 1889, when the pressure of other engagements necessitated his resignation. Early in 1890 he was appointed the first Professor of Electrical Engineering and Applied Physics in the Heriot-Watt College, Edin-

Digitized by Google

burgh. He is a member of the Institution of Electrical Engineers, a Fellow of the Chemical Society, and a member of the Physical Society. He partly revised and extended the last edition of Dr. Urbanitzky's "Electricity in the Service of Man," and has just completed a thorough revision of the same book for a new edition. He also assisted in the translation and extension of Guillemin's "Electricity and Magnetism." At the request of the Council he read a Paper on the "Electrical Exhibits at Edinburgh" before the Institution of Electrical Engineers on the occasion of its visit to Edinburgh in 1890. He is a Sub-Examiner of the University of London, and was elected a Fellow of the Royal Society of Edinburgh in 1891.

WALTENHOFEN, Dr. Adalbert von. Born in Styria, May 14, 1828.

Dr. Waltenhofen studied at the University and at the Polytechnic Institution at Vienna. In the first period of his public career he was assistant to the Professors of Mathematics and Physics in the University of Graz, in Styria. In that University he also obtained the degree of Doctor of Philosophy. He was then engaged to teach mathematics and physics in the Gymnasium and in the Polytechnic Institution, "Joanneum," in that town. Soon afterwards Dr. Waltenhofen was appointed Professor of Natural Philosophy in the University of Innsbrück, in Tyrol, where he at first established a physical laboratory, and remained (1853-1867) until he was appointed Professor of Physics in the Technical High School at Prague. In that position he also established a physical laboratory, and introduced lectures on electrotechnics (1880). He also delivered lectures for telegraph officers, and in the telegraph office at Prague he had the opportunity of practising the methods of testing underground cables and overland wires.

In the year of the Vienna International Electrical Exposition (1883) Dr. Waltenhofen was charged by the Government with the establishment and organisation of a school for electrical engineering connected with the Technical High School at Vienna. Since that time he has been Professor of Electrical Engineering and Director of the Vienna Electrotechnical Institution. Dr. Waltenhofen is correspondent of the Imperial Academy of Sciences at Vienna, member of the Bohemian Royal Society of Sciences at Prague, and honorary member of the Physical Society of Frankfort. He has exhibited instruments and apparatus of his own invention in the South Kensington Exhibition at London (1876), and in the Electrical Exhibitions at Paris (1881), Munich (1882), Vienna (1883), and Frankfort (1891). He gained a diploma for his exhibit at the Paris Exhibition, and for some time he was at work in the testing department of the Munich Exhibition. In the years 1883, 1886, and 1889 he was sent by the Government to visit the technical schools in Germany, especially with respect to arrangements for electrical purposes. Since 1889 he has been President of the Internationale Electricitäts-Gesellschaft in Vienna. He was elected an honorary member of the Frankfort Electrical Exhibition in 1891. Dr. Waltenhofen has published many Papers in the *Reports* of the Vienna Academy of Sciences, in the *Annals* of Poggendorff and Wiedemann, and in the German electrotechnical journals. The most important of these Papers deal with the following matters:—"On the Electromagnetic Properties of Steel (1863);" "On an Anomalous Magnetisation of Iron (1863);" "Researches on the Electromagnetism of Iron (1865, 1870);" "On the Limits of Magnetisation of Iron and Steel (1869);" "On the Electromagnetic properties of Iron Filings and Iron Powder (1870, 1879);" "Electromagnetic Balance, showing by a Striking Experiment the Different Magnetic Properties of Soft Iron Tubes and Solid Cylinders (1870);" "A New Method of Measuring the Resistance of a Voltaic Cell (1868);" "Discovery of the Inversion of Lullin's Experiment (1866);" "Discoveries concerning the Perforation of Glass by Means of Electric Sparks (1866, 1879);" "On Testing and Calculating the Efficiency of Electromagnetic Machines Driven by Voltaic Batteries (1867, 1868);" "On the Electromotive Force of Daniell's Cell (1868, 1884);" "On the Portative Force of Electromagnets (1870, 1885);" "On the Limits of Lenz and Jacobi's Law of Magnetisation (1871);" "On the Thermo-Electric Piles of Noë (1871, 1872, 1877);" "Discovery of a New Phenomenon to be Observed in the Asymmetrical Thermo-electric Piles (1877, 1883);" "On the Firing by Means of Electric Sparks at Great Distances;" "Experiments made on Telegraph Lines between Prague and Vienna (1876);" "Pendulum Apparatus, Showing a Striking Effect of Foucault Currents (1883);" "On the Characteristic Curves of Deprez and Hopkinson (1885);" "Researches on the Efficiency of Storage Batteries, made by Farbaky and Schenek (1886, 1887);" "On New Useful Formulæ for Calculating the Power of Electromagnets (1886, 1887);" "On the Thermal Waters of Gastein (1885);" "Remarks on Dr. Frölich's Theory of Dynamo-Electric Machines (1886, 1887);" "General Rules on Ring and Drum Armatures (1887);" "Reports and Remarks on Storage Batteries (1888);" "On Determining the Efficiency of Accumulators (1888);" "On the Tudor Accumulators (1889);" "Insulation Measurements at the new Court Theatre at Vienna (1889);" "On the Theory of several Formulæ used for Electromagnets (1889)." Dr. Waltenhofen has also written the following books:—"Outlines of Mechanical Physics (1875);" "On the Electrical Units," second edition (1892); "On Lightning Conductors (1890);" and many articles in "Karmarsch and Heeren's Technological Dictionary."

WARD, George Gray. Born at Great Hadham, Hertfordshire, December 30, 1844. Educated at a private school at Cambridge.

Mr. Ward developed a taste for telegraphy at the age of ten, and received a prize for his knowledge of the art. On leaving school he entered the Electric Telegraph Company, and after passing through the various grades of the

Digitized by Google

service at different stations, resigned in 1865, and joined the Egyptian Government Telegraph Service, and was stationed for about three years at Alexandria. Mr. Ward was one of the few who stuck to his post during the cholera of 1865, and his valuable services rendered to the Government at that period were specially acknowledged by Ismael Pacha, the late Viceroy. Finding the field for advancement was not very large in that service, he resigned, and accepted a position with the first French Atlantic Cable Company (1869), and was selected to accompany the "Great Eastern" as a member of the electrical staff during the laying of the cable. Mr. Ward was stationed at St. Pierre-Miquelon, and remained there five years. In 1874, owing to ill health, he resigned his position and returned to England. He afterwards joined the Direct United States Cable Company as Superintendent, and organised that company's system in the United States, making his headquarters in New York. Previous to the advent of the Direct Cable it was considered a great feat to receive an answer to a cablegram from London inside of thirty or forty minutes. Mr. Ward so improved the service that he reduced the time to a minimum, and it is now an everyday occurrence to receive replies in less than five minutes. He made the Direct Cable Company very popular, not only with the public but with the Press. In 1884 he accepted the post of secretary and general manager of the Commercial Cable Company. In 1890 he was relieved of the position of secretary, and elected vice-president of the Company, and in this position those qualities of sound generalship which have characterised Mr. Ward's connection with the Commercial have enabled him to achieve great successes in the interests of the cabling public by perfecting an up to date, unique transatlantic service, whilst his urbanity, consistent impartiality, and tact in the administration of the Company's internal affairs, have merited the confidence and affection of the many members of the Company's staff. Mr. Ward's skill and diplomacy have more than once brought delicate and important negotiations entrusted to him to a successful issue. His relations with the officials of the telegraph companies of America and Europe, whether opposed to his company or not, have always been most pleasant. Mr. Ward is Honorary Secretary and Treasurer of the Institution of Electrical Engineers in the United States.

WEBB, Francis Hughes. Born in London, December 8, 1824. Educated at University College School, and the École Normale, Brussels.

Mr. Webb was two years in Germany with John Player, C.E., engineer to the British Nassau Iron Company, and was afterwards appointed clerk in the audit office of the London, Brighton, and South Coast Railway, with the promise of the first vacancy in the Engineer's Office. In 1844 Mr. Webb obtained the appointment of resident secretary and librarian to the Royal Institute of British Architects, which he resigned in 1850 in order to enter the service of the Electric Telegraph Company as assistant to Mr. Edwin Clark, then engineer-in-chief. The following year he accepted the appointment of private secretary to the Chairman of that Company, the late John Lewis Ricardo, M.P., who was interested in various other large undertakings, and with whom he remained until the year of that gentleman's death, 1862, and on whose behalf he had to carry out many important negotiations. During that period he was brought much into communication with the late Robert Stephenson, George P. Bidder, and Messrs. Peto and Brassey; and the latter firm appointed him as confidential auditor on their various works at home and abroad. In 1865 he again entered the service of the London, Brighton, and South Coast Railway as assistant secretary, which appointment he resigned in 1867, and renewed his association with Mr. Edwin Clark, then largely engaged in engineering work. Mr. Webb was secretary to the Nova Scotia and New Brunswick Railway Company, the Malta Hydraulic Dock Company, and the Montevideo Harbour Improvements Company.

In 1878 he was appointed secretary to the Society of Telegraph-Engineers, the duties of the office not then necessitating his relinquishment of the other appointments which he held at the time; but in 1885 the Council found it necessary (owing to the growth of the Society) that he should devote his entire attention to the Society's affairs, including the editing of the *Journal*. The Society—now the Institution of Electrical Engineers—has considerably more than doubled its number of members since Mr. Webb's appointment as secretary, and it is certainly not too much too say that this result is largely due to his exertions.

WEBB, Frederick Charles. Born on the 1st of October, 1828, at 14, Surrey-square, Old Kent-road, London, S.E.

Mr. F. C. Webb is the son of the late Mr. George Webb, formerly secretary to the committee of the London Stock Exchange. He received his early education at a private school at the Mansion House, Hammersmith, being afterwards placed at the Ecole Normale, at Brussels. Having learned French there, he afterwards studied geometry, trigonometry, and navigation under M. Verhaart, professor of mathematics at the School of Navigation at Ostend; was placed for two years at the establishment of the Rev. Edward Jenkins (Chaplain to the King of the Belgians), at Brussels, where, amongst other subjects, he learned free-hand drawing and water colours, mechanical drawing, and fortification. At the age of fifteen he joined H.M.S. "Porcupine," a surveying ship, commanded by Capt. Frederick Bullock, R.N., but held no position in the Navy (except for a short time when he was rated as clerk's assistant), the object being to qualify him as a marine surveyor, so that on his obtaining a naval cadetship, which Captain Bullock hoped to procure for him, he might at once receive the extra pay granted to the officers employed as surveyors. He was thus engaged for two years doing duty

Digitized by Google

as a surveying officer, &c. During the two years he was in H.M.S. "Porcupine" the survey known as "The Downs," which includes the Goodwin Sands, was completed, and the freehand sketches of the leading marks, &c., were done entirely by Mr. Webb. He was also present at the erection of one of Captain Bullock's safety beacons on the Goodwin. The survey of the "Approaches to Harwich" was also completed whilst he was in the "Porcupine." Having waited and worked patiently for two years without pay, and not having sufficient interest to obtain a cadetship, he at last gave up the attempt, and the railway mania of 1845 breaking out, he left the "Porcupine," and, under Mr. John Player, was engaged on the levels for the London, Newbury, and Bath Direct Railway. He was then placed with Mr. James Walker, of 23, Great George-street, Westminster, engineer to the Admiralty, Trinity Board, Commercial Docks, &c., and was in that office grounded in all the duties of a civil engineer, such as drawing, tracing, taking out quantities, estimating, &c., and during the time he was with the firm the works in hand were the improvement of the Bedford Level drainage, the Admiralty Pier at Dover, the harbour of refuge at Alderney, St. Helier's Harbour, improvement of Dover Harbour, improvement of Kurrachee Harbour, a new lantern to Eddystone Lighthouse, and other work. A particular manner of placing the supports of the roof, suggested by Mr. Webb, was approved and adopted on the Eddystone and in several other lighthouses. He took the soundings for the contract drawings of the Admiralty Pier at Dover, and for the harbour of refuge at Alderney. Mr. Webb soon afterwards joined the Electric Telegraph Company, under Mr. Edwin Clark, and became engaged almost solely in telegraph work, and executed the following: — The making of a complete set of surveys of the London street wires, of which no record had previously been kept; the erection of two wires between Brighton and Newhaven; six wires between London and Peterborough, and two on to Grimsby; some ten wires on the North London Railway; the surveys of the Lancaster and Carlisle, Maryport and Carlisle, and Stour Valley Railways. In 1853 the Electric Telegraph Company determined to lay cables to Holland, and Mr. Webb was appointed assistant engineer to the International Telegraph Company, and was engaged on the laying and repairing of these cables and the Irish cables till 1857. To carry out this work the Electric and International Telegraph Company purchased the "Monarch" paddle-wheel steamer, of about 500 tons, and she was fitted in 1854 with the first single-drum picking-up machine made, designed by Mr. E. Clark and Mr. Webb, improvements on which are embodied in the more recent machines now in use. Mr. Webb was engaged as one of the four engineers for the first expedition (in 1857) to lay an Atlantic cable, and and in 1858 he was engaged in laying cables in the Mediterranean. In 1859 he was engaged on the experiments made at Gloucester-road for the joint committee appointed by the Board of Trade and the Atlantic Telegraph Company, and during this time had the honour of showing to Faraday the "coil current," or, as it was for some time called, "Webb's current." He also tested and reported on the 1858 Atlantic cable as regards the distance of the fault. His report showed how the resistance of the fault could be roughly ascertained by the *change in its resistance* caused by sending a negative current after sending a positive, which has since received the attention of many electricians. In the same year he was deputed by the Directors of the Red Sea and India cable to test the sections between Aden and Kurrachee, and received on his return the thanks of the Board for "his full and interesting report." In January, February, and March, 1861, he was engaged in the "Resolute" tug in trying to repair the Emden cable. In 1863 and 1864 he was engaged under Messrs. Bright and Clark on the first Persian Gulf cable, and afterwards he was engaged by the Indian Government to remain out for one year in "engineering charge of the line," to teach the staff to repair the cable, to complete some of the work, and to design proper premises for the storage and repair of the recovered cable. These works were carried out by Capt. Mereweather, R.E., and have given entire satisfaction. Mr. Webb came home from India in 1865. In 1867 he had charge, on the part of the contractors (the India Rubber, Gutta Percha, and Telegraph Works Company), of laying a cable from Havanna to Key West (Florida), and from Key West to a lonely place called Punta Rossa, 120 miles up the Gulf of Mexico. In 1868 he was engaged in fitting out the ships for the second Persian Gulf cable, recovering sixty miles thrown overboard from the "Calcutta," and taking all the rest of the cable out and reshipping it, and received the thanks of his Excellency in Council the Governor of Bombay. Mr. Webb, for the India Rubber Company, laid the Post Office cable between Holyhead and Howth, and received Lord Spencer, the Lord-Lieutenant, on board the "La Plata." He also for the same company acted as second to Sir S. Canning in laying the Marseilles and Algiers cable, and repaired it, and recovered the whole of the cable laid during the Franco-German war between Cherbourg and Dunkerque. He laid the Direct Spanish cable between Bilbao, in Spain, and the Lizard, and repaired it two successive years. He also laid the Marseilles and Barcelona cable, and diverted the Direct Spanish cable during the Carlist war from Bilbao to Santander. In 1874 he was engaged by Messrs. Siemens Brothers to command an expedition to complete the Platino-Braziliera cable, and recover 170 miles of cable out of the wrecked steamer "Gomos," and was then made a Knight Officer of the Imperial Order of the Rose by H. I. Majesty the Emperor of Brazil, whom he had the honour of entertaining on board the "Ambassador." This was the last work he executed, but he was afterwards consulted by the Indian Government on the third Persian Gulf cable. In 1877 he was appointed electrician to H.M.S. "Vernon," the torpedo school ship; but his health failed him, and he had to relinquish the appointment, which

Digitized by Google

was never again filled up. He is probably the only member of the Institution of Civil Engineers who has been entitled to R.N. after his name. Mr. Webb is the author of a Paper "On the Practical Operations Connected with Paying-Out and Repairing Submarine Cables," which was read at the Institution of Civil Engineers, on the 23rd of February, 1858. He is also the author of several articles in the *Philosophical Magazine*, and of a narrative entitled "Up the Tigris to Bagdad." Some of his articles in *The Electrician* (old series) were republished in book form, under the title of "A Treatise on Electrical Accumulation and Conduction." In these articles he showed that induction takes place in a circuit which he has termed "the inductive circuit." He contributed to *The Electrician* a series of articles on "The Voltaic Circuit Geometrically Illustrated," and another series detailing some of his experiences in submarine telegraph engineering, entitled "Old Cable Stories Retold." He patented a means of preventing the teredo from attacking the gutta percha of submarine cables, and showed how the ordinary sextant may be made to take larger angles. Several of these instruments, which were certified at Kew Observatory as taking 163 degrees, were made, and one was taken by Captain Charles Bullock, R.N., on his survey in Japan, as Captain Bullock perceived and declared that the improvement was of immense importance. He was made an associate of the Institution of Civil Engineers in 1857, and promoted to membership in 1868, and on November 26th, 1884, was by the Council, in consideration of the services rendered by him to the Institution, and of his long connection with it, enrolled as a life subscriber.

WEBB, Herbert Laws. Younger son of F. C. Webb. Born in London in 1864. Educated at private schools and at University College School, London.

Mr. Webb left school in 1880, and in the same year made acquaintance with practical electrical work in the expedition sent out by the India-Rubber, Gutta-Percha, and Telegraph Works Company to lay the third Marseilles-Algiers cable. Afterwards he had charge for some time of some chemical experiments at the paper mills of Messrs. John Dickinson and Co. Having a hereditary bent for submarine cable work, he joined the Silvertown Company again in 1881, and served on the expedition that laid the extensive system of cables of the Central and South American Telegraph Company. For the Telegraph Construction and Maintenance Company he accompanied the expedition that laid the third Red Sea cable, in 1883, and later in that year he went back to the Silvertown Company to take part in the work of laying the Spanish National cables between Spain and the Canary Islands. Mr. Webb has treated of submarine cable work in several Papers and articles, among them one written specially for Messrs. Scribners, and included in their book entitled "Electricity in Daily Life." After several years in the service of the Spanish National Submarine Telegraph Company, during which time he also, with his partner (Mr. Wilson), conducted a general electrical contracting business, Mr. Webb went to America, where he turned his attention to telephone work. He was for several years assistant electrician to the Metropolitan Telephone and Telegraph Company, and resigned this position to take the post of Editor of the American journal, *Electricity*. At the present time he is connected with the Metropolitan Telephone Company in a special capacity. Mr. Webb is the author of a simple book on testing, "A Practical Guide to the Testing of Insulated Wires and Cables," of the "Telephone Handbook," which deals with American telephone practice, and of numerous articles and Papers, both practical and popular, on telephony and other electrical subjects. He is a Member of Council of the American Institute of Electrical Engineers, and a Member of the Institution of Electrical Engineers.

WEBBER, Major-General Charles Edmund, C.B., R.E. (Retired.) Born in Dublin, 5th Sept., 1838. Was educated at the Royal Military Academy, Woolwich, and obtained his first commission in the Royal Engineers in April, 1855.

Major-General Webber's war services comprise the Indian Mutiny, 1857 to 1859, and he was attached to the headquarters of the Prussian army in the Austro-Prussian war of 1866. He was employed in Asia Minor in collecting transport for the Abyssinian Expedition. In 1879 and 1880 he was in Zululand, Natal, and latterly in the Transvaal, with the Egyptian Expedition of 1882, employed as Staff-Officer for Telegraphs; present at the battle of Tel-el-Kebir, A.-A. and Q.-M.-General and Director of Army Telegraphs with the Nile Expedition of 1884-5, until invalided in May, 1885, retired from the service with the honorary rank of Major-General in 1885. In 1867 (as a captain) he was attached to the British Commission at the International Universal Exhibition at Paris; superintended the erection of all the buildings undertaken by the Commission, and was in charge of the experiments in heating and lighting carried on in the English test-house. In 1870 he was placed, under the orders of the Postmaster-General, in command of the 22nd and 34th companies of Royal Engineers for service in the Postal Telegraph Department; appointed a Divisional Engineer, first of the Eastern, and afterwards of the Southern Division of the Postal Telegraphs. During the early years of the development of this great service, he was intimately connected with the extension of the system in various parts of Great Britain, and during that time up till 1879, while carrying on the duties of construction and maintenance of telegraphs, as an officer of the Postal Telegraph Department, was instrumental in training in all branches of telegraphy over 300 officers, non-commissioned officers, and soldiers of the Royal Engineers, whose services have since been of value in several military operations. In 1870 and 1871 he and Colonel Bolton originated and founded

Digitized by Google

MAJOR-GENERAL C. E. WEBBER.

Digitized by Google

the Society of Telegraph-Engineers, of which he has since been either the treasurer or a member of Council, and in 1882 he was elected the president of the year. In 1878 (when a major) he was appointed by H.R.H. the Prince of Wales British juror for telegraph apparatus at the International Exhibition at Paris. In 1881 he was appointed by Her Majesty's Government one of the British Commissioners for the Electrical Exhibition at Paris, and was also one of the members of the International Electric Congress held the same year in Paris. In reward for these services the 3rd Class of the Legion of Honour was conferred on him by the French Government, in common with the other Commissioners, but as a military officer he was not allowed to receive it. He was also a member of the General Council, and of the Jury for the Electrical Exhibition at the Crystal Palace in 1882, and was a member of the Electrical Jury at the Health Exhibition in 1884. Major-General Webber was charged with experiments in connection with prizes, offered by the Society of Arts in 1872, for inventions in apparatus for heating and the utilisation of fuel, and has thrice sat as a member of council of that society. He is the author of several papers in the *Journal* of the Society of Telegraph-Engineers and Electricians, and on many military subjects. He is a Member of the Institution of Civil Engineers, and a Member of Council of the Royal Albert Hall Corporation. He was first managing engineer and director, and afterwards consulting electrical adviser, of the Anglo-American Brush Electric Light Corporations from November, 1885, to July, 1889; is deputy chairman and consulting engineer of the Chelsea Electricity Supply Company, (Limited); was chief engineer of the City of London Electric Lighting Company; and is an original member of the Société Internationale des Electriciens.

WETZLER, Joseph, M.E. Born at Hoboken, N.J., December 6, 1863.

He received his primary education at the Hoboken Academy, where he graduated first scholar. He then entered the Stevens Institute of Technology, where he pursued the four years' course and obtained the degree of mechanical engineer in 1882. He then took up actively the study of electricity, and entered the Weston Works at Newark, N.J., where he passed through all the departments and became thoroughly conversant with the manufacture of dynamo-electric machinery. The state of his health compelling him to seek a less active occupation, he took up the literary branch of electricity, and after a short period on the editorial staff of the *Scientific American*, undertook in January, 1885, the editorship of the *Electrical World*, associated with Mr. T. C. Martin. In April, 1890, Mr. Wetzler was offered the editorial management of the *Electrical Engineer*, in conjunction with Mr. T. C. Martin, and since then his work has been exclusively devoted to the interests of that journal. Besides the innumerable articles from the pen of Mr. Wetzler appearing in the electrical journals, he is also the joint author with Mr. T. C. Martin of "The Electric Motor and its Applications," a pioneer work which has passed through three editions; and with Mr. Martin has recently undertaken the editorship of the electrical department of the new edition of Appleton's "American Cyclopædia of Applied Mechanics.' He also contributed the article on "Electric Railways" to the recent electrical series of *Scribner's Magazine*. Mr. Wetzler is one of the oldest members of the American Institute of Electrical Engineers, has been a member of its Council for a number of years, and recently one of its Vice-Presidents. He was also one of the delegates of the American Institute of Electrical Engineers to the Paris Electrical Congress in 1889. He has also been prominently connected with the New York Electrical Society, and is now its President for the second time.

WHARTON, Charles Joseph, son of the late Rev. C. C. Wharton. Born at Weymouth in 1857; educated at Coventry and Worthing.

Mr. Wharton's attention was first turned to electricity at the great Paris Exhibition, and soon after he commenced experiments with a modification of the Bunsen battery as applied to motors for rock drills in mines and for launch work. Becoming acquainted with the late Count Th. du Moncel, he arranged for the rights of his two works on "Electromagnets" and on "Electricity as a Motive Power," which he published in English. Having secured the London agency of the original Swan Company, he entered into partnership with the late Mr. J. G. Laing, and subsequently, with the assistance of Mr. F. J. Down, the now well-known firm of Laing, Wharton and Down was formed. In 1883 he was asked to revise and edit the English version of M. Hospitalier's "Domestic Electricity," which was soon after published. Meanwhile his firm carried out many important installations, some of them under his direct supervision. In the beginning of 1885 he was delegated by his firm to make a tour in the United States for the purpose of investigating the various systems of arc-lighting in vogue there, and after some negotiations obtained the sole control of the Thomson-Houston system for England. Messrs. Laing, Wharton and Down exhibited this system at the International Inventions Exhibition that year, lighting the east gallery and arcade, with the result that they were accorded the only gold medal for arc-lighting. Since then the firm have carried out many and varied installations, both arc (Thomson-Houston) and incandescent (Edison-Swan), as well as for transmission of power. Mr. Wharton is a member of the Institution of Electrical Engineers, and also was one of the original founders of the Electrical Trades Section of the London Chamber of Commerce.

WHEELER, Schuyler S.

Upon leaving Columbia College in 1881, Mr. Wheeler became assistant electrician of the American branch of the Jablochkoff Electric Light Company. When that company dissolved he joined the United States Electric Light Company, and subsequently left them to

Digitized by Google

become a member of Mr. Edison's staff. Mr. Wheeler was present at the inauguration of the Pearl-street Station, was made electrician in charge, and was detailed to lay the underground systems in other cities. He afterwards became superintendent of the Newburgh Edison Company, resigning that position to accept the post of electrician to the Herzog Teleseme Company. Mr. Wheeler subsequently joined the "C. and C." Electric Motor Company as electrician and factory manager. After establishing the factory of the "C. and C." Electric Motor Company, he organised the firm of Crocker and Wheeler, electrical engineers, since incorporated as the Crocker-Wheeler Electric Company, of which he is the president. He is also Electrical Expert to the Board of Electrical Controlof New York, which position he has occupied since the Board was constituted six years ago. He is a member of the American Society of Civil Engineers, the National Electric Light Association, the American Institute of Electrical Engineers, and the American Society of Mechanical Engineers; and has received the honorary degree *Scientiæ Doctoris* for recent original work done in electricity.

WIEDEMANN, Eilhard. Born at Berlin, 1852.

Mr. Eilhard Wiedemann is the son of Mr. Gustav Wiedemann. He was Privat docent at Leipzig, then professor at Darmstadt, and is now professor at Erlangen. His principal Papers are—"On the Elliptic Polarisation of Light when it is Reflected from Bodies with Surface Colours," "On the Specific Heat of Gases and Vapours," "On Electrical Discharges," "On Phosphorescence and Fluorescence," "On the Mechanics of Luminosity." In these researches he has shown that the gases in Geissler tubes may be luminous at temperatures much below 100°C., &c. He is editor of the *Beiblätter zu den Annalen der Physik und Chemie*, and is joint editor with Dr. Ebert of "Physikalisches Praktikum."

WIEDEMANN, Gustav Heinrich, Doctor of Philosophy and Medicine; Professor of Physics at the University of Leipzig. Was born on the 2nd October, 1826, at Berlin, where his father was a wholesale merchant; received his first education at the Gymnasium in Berlin, which was under the direction of August, Professor of Physics, and where a fundamental education was imparted in classical languages as well as mathematics and natural science.

At an early age Prof. Wiedemann commenced his studies when he was eighteen years old at the Berlin University, these being principally directed to physics, chemistry, and mathematics, and he had the good fortune to enter the private laboratory of Magnus, which was only accessible to a few scholars. Under the guidance of this excellent experimentalist (1845-47) he completed his first chemical researches respecting biuret, a derivative of urea, and in 1847 he became Doctor of Philosophy. His inclinations and the continual impulse he received through his intercourse with Magnus soon led him to devote his attention to physics, and as early as the year 1849 he published his researches respecting the electric conducting power of crystals, which were soon followed by other works on the magnetic rotation of the plane of polarisation, electrical endosmose, the coincidence of the conductibility of metals for heat and electricity (the last in conjunction with W. Franz). After marrying the eldest daughter of the celebrated chemist, Eilhard Mitscherlich, Prof. Wiedemann was appointed in 1854 to an ordinary professorship at the University of Basle, whence he went to the technical high schools in Brunswick (1863) and Karlsruhe (1866). In 1871 Prof. Wiedemann undertook the professorship for physical chemistry in the Leipzig University, which he exchanged in 1887 for the professorship of physics at the same place. At this time he followed up the experiments, commenced in 1859 and continued until quite recently, respecting the torsion, flexion, and magnetism, as well as the relations existing between the mechanical and magnetic properties of bodies, by which the complete analogy between them was demonstrated, and the processes that take place in magnetising were referred to the principle of subsequent elastic action (which has been recently termed in England "hysteresis"). He also published a series of researches respecting the magnetic relations of chemical combinations, by which the simple relations existing between chemical combinations and the magnetism of bodies were explained. He also wrote on electric discharges, &c., and made a new determination of the ohm. Moreover, Prof. Wiedemann published, in 1863, a work on galvanism and electro-magnetism, the second edition of which, in three volumes, appeared in 1871; and the third, in five volumes in 1885, under the title "Die Lehre von der Electricität," contains an exceedingly complete and critical treatise on this subject, interspersed with many original and theoretical suggestions. Since 1877 Prof. Wiedemann has edited the *Annalen der Physik und Chemie*, which used to be published by Gren, Gilbert and Poggendorf. Amongst the many academical honours bestowed on Prof. Wiedemann may be named his nomination as foreign member of the Royal Societies of London and Edinburgh.

WILKINS, J. W. Born March, 1827.

Mr. Wilkins began his telegraph career at a very early date. Originally intended for the profession of civil engineer, he commenced a course of practical instruction in the establishment of Mr. Thomas Cubitt, the eminent builder, and after a little less than two years' work there, made a start in engineering. An early *penchant*, however, for electricity, which was fostered at the school he attended in his boyhood, was the basis of his introduction to the telegraph. Mr. Wilkins thereon abandoned all idea of qualifying for any other profession, and entered the workshops of Mr. Robert Reid, telegraph instrument maker, on the understanding with Mr. W. F. Cooke that he should become practically acquainted with the mysteries of electricity as applied to telegraphs with the object of his qualifying himself for

Digitized by Google

the superintendence of lines then in contemplation. During the first few months Mr. Wilkins had the opportunity of assisting in the maintenance of the two or three experimental lines then existing, in company with the sons and *employés* of Mr. Reid, and also at times with Mr. Cooke himself, who at that date personally attended to whatever was necessary to be done in the way of keeping the lines in efficiency and order. The Northampton and Peterborough Railway telegraph was the first line considered of sufficient importance to necessitate the presence of a resident superintendent. Mr. Wilkins assisted Mr. Cooke to open this line by July 1, 1845, and remained a few months after, until Mr. Wm. Highton, C.E., who was appointed to the superintendence of the electric telegraph on the "London and Birmingham line and branches," relieved him of his charge. After this Mr. Wilkins practically took over the general superintendence of all the lines that had been erected during the interval of his residence on the Northampton and Peterborough Railway, including Hull on one side of England and Fleetwood on the other, and from Rugby to Newcastle, and the extension that was then being rapidly pushed on toward Berwick-on-Tweed. Very soon, in consequence of the rapid extension of the telegraph all over England, the area of Mr. Wilkins's superintendence narrowed, and on the completion of the line from Rugby to London in 1848, connecting the Metropolis with the rest of England, he was in charge of the line and a temporary terminus for London in Seymour-street, Euston-square. In 1851, accepting a tempting offer to erect telegraphs in the United States of North America for one O'Rielly, who had a general contract with Prof. Morse to erect telegraph lines at a royalty per mile, Mr. Wilkins found soon after his arrival that the principals to the contract were at issue in the matter of the construction by which it was proposed to connect New York with New Orleans. It becoming evident that no work was likely after all to be done for some time, after erecting a line of telegraphs from Boston to Portland, Maine, in 1851, for the "Associated Press" of New York, Mr. Wilkins transferred his services, at Mr. O'Rielly's suggestion and introduction, to the contractors for the Ohio and Mississippi Railroad. From this date (the end of 1852) Mr. Wilkins was engaged in America and over a good part of Europe on public works for the late Thomas Brassey, the well-known contractor, with whom he remained until Mr. Brassey's demise. About 14 years ago, on the occasion of the death of Sir W. Fothergill Cooke, and the appearance about the same time of a Post-Office report of the immense amount of work then done by the telegraph, Mr. Wilkins wrote a short note, which appeared in the columns of the *English Mechanic* for September 5, 1879, under the initials "J. W. W." This letter was noticed by Mr. Latimer Clark, who asked for further information about the "earlier days of the electric telegraph." The information was given in the next number (September 19th). These letters can be referred to by those desirous of learning something of what occurred in telegraph matters before the introduction of gutta-percha, or the incorporation of the first "Electric Telegraph Company" in England.

WIMSHURST, James. Born April 13, 1832; is the second son of the late Mr. Henry Wimshurst, whose name was associated with the introduction of the screw propeller.

Mr. Wimshurst was educated at Stebonheath House, London, at which school he acquired the rudiments of several branches of science. Circumstances made it, however, desirable that he should adopt a business life, and for several years he worked for his father. He then joined the professional staff of Lloyd's Register of Ships, and fulfilled those duties for about eight years. A little later he accepted the chief position with the Liverpool Register of Shipping, when, after ten years' successful work, he received an appointment to a principal position in the Consultative Branch of the Board of Trade, the Liverpool Committee at that time presenting him with a substantial testimonial; and in 1890 he was one of the representatives of the Board of Trade at the International Conference held at Washington, U.S. Most men would have been contented to have run so useful a career, and have availed themselves of the spare hours to enjoy social pleasures, but it was not so with Mr. Wimshurst. From the beginning he had always maintained a well-fitted laboratory, his practical training enabling him to readily put his thoughts into substantial form, and by actual test to determine whether or not to further pursue any subject. In this way photography, chemistry, engineering, electricity, and other branches of study have each obtained a share of his attention, but his work for many years was known only to his most intimate friends. Since 1882, when Mr. Wimshurst published the particulars of a large and very powerful influence machine which he had designed and made, he has continued to perfect various forms of apparatus for the production of large quantities of statical electricity under atmospheric conditions which would be fatal to the working of any other type of instrument. These machines are now well known throughout the world by his name. He has also designed and made a very useful form of mechanical air-pump, which rapidly produces high vacuum, and which, from its design, is absolutely free from leakage, the degree of vacuum being, however, limited to the vapour density of the lubricant used. Mr. Wimshurst's own house affords evidence of his practical and scientific tastes. He has a complete installation for electric lighting, designed and executed by himself and his two sons, while his home collection of apparatus is, we believe, quite unequalled. A notable feature in Mr. Wimshurst's work has been his steady and persistent refusal to accept anything from any source in the nature of pecuniary advantage from his scientific labours. Nearly all the scientific institutions in the country possess his machines,

Digitized by Google

while his advice or assistance, based on long experience and wide knowledge, have been always freely at the service of the student and investigator. In 1890 he was given a seat on the Council of the Physical Society, when he introduced a new form of influence machine which produces rapidly-alternating charges of electricity; and he has recently put forward another type of influence machine which possesses many useful features.

WINSLOW, I. E. Born in Brooklyn, N.Y., in 1865. Educated at the Brooklyn Polytechnic Institute.

In 1887 Mr. Winslow entered the employ of the American Electric Manufacturing Company of New York, and installed several arc light plants. After a short time with the Daft Company, in the fall of 1888 he joined the Thomson-Houston Electric Company, and during the time he was employed by them he was chiefly engaged in electric traction work, having installed about a dozen tramway plants with uniform success in various parts of the United States, Canada, and British Columbia. He also installed the Roundhay Electric Tramway at Leeds, and is now again managing it.

WOLCOTT, Townsend. Born in New York, in July, 1857.

Mr. Wolcott worked in his father's shop as a practical mechanic, and in his leisure studied mathematics and science. He has been for some years engaged in the practical applications of electricity, and has experienced the usual ups and downs of a busy life. He had a desire to devote his whole time to pure science, but circumstances decided that this could not be. Mr. Wolcott has been associated with a number of electrical companies, several of which, however, have ceased to be. In 1880 Prof. C. A. Seeley employed him to superintend the construction of a dynamo of his (Prof. Seeley's) invention, known as the "Arago Disc" Dynamo, at the works of Messrs. Lovejoy, Son, and Company, of New York, the machine being used by this firm for electrotyping. From here Mr. Wolcott was transferred to Mr. Weston's laboratory at the United States Electric Company's works at Newark, N.J. He has since been associated with the Sprague Electric Railway and Motor Company, the Julien Electric Traction Company, the Mutual Electric Manufacturing Company, the New American Electrical Arc Light Company, and the Astoria Electrical Manufacturing Company. In 1889 King's College, Nova Scotia, offered him the newly-created Chair of Electrical Engineering, but on account of other engagements he was unable to accept it. Mr. Wolcott once studied Civil Engineering, but, like our worthy fellow-countryman, Herbert Spencer, did not find much encouragement in it.

WOODBURY, C. J. H. Born at Lynn, Mass., and educated in the public schools of his native city, and at the Massachusetts Institute of Technology, where he took the course in civil engineering.

Mr. Woodbury's first important professional engagement was as assistant to boards of engineers in making tests of water-works pumping engines in various eastern cities, beginning in 1873, under the supervision of James B. Francis, C.E., on tests of the first compound pumping engines used in America. In 1878 he entered the employment of the Factory Mutual Insurance Companies as special inspector and engineer. The subjects which especially engaged his attention were lubrication and the fire risks of electric lighting, and automatic sprinklers. In 1885 he received from the city of Philadelphia the John Scott medal "for securing safety in the use of electric lighting in mills." Mr. Woodbury's work has been largely in connection with the interests of the Underwriters of Fire Risks in America. As an engineer he has been consulted on many of the principal light and power installations in the States, as well as upon some British installations, and is a Vice-President of the Boston Manufacturers' Mutual Fire Insurance Company.

ZETZSCHE, Karl Eduard, Doctor of Philosophy. Born in 1830, in Altenburg, Saxony.

Visited from 1851 to 1856 the Polytechnic Schools and the University in Dresden and Vienna, and afterwards took employment in the Austrian Telegraph Service in Vienna, Padua, and Trieste. He went in 1858 to Chemnitz, Saxony, where he became teacher of mathematics and mechanics at the Royal Technical High School, and in 1876 he accepted the chair of Professor of Telegraphy at the Polytechnic School in Dresden. In 1880 he went to Berlin and became editor of the *Elektrotechnische Zeitschrift* (1880-1886) and telegraph engineer to the German Postal Service (1880-1887). He now resides at Dresden, devoted solely to his literary and scientific occupations. He has published several books on geometry, trigonometry, and telegraphy, most of them having had several editions. His latest work is "Der Betrieb und die Schaltungen der elektrischen Telegraphen" (1890 and 1891), which is complete in itself, although forming the second part of the third volume of his "Handbook of Electric Telegraphy" (four volumes). For the fourth volume of this work he and Herr Kohlfurst received in 1881 an honorary diploma at the Paris Exhibition, and in 1882 they were awarded a prize of M.1,500 by the Verein der deutschen Eisenbahnverwaltungen. Dr. Zetzsche is a foreign member of the Institution of Electrical Engineers, member of the Electrical Societies of Dresden and of Austria, of the Saxon Society of Engineers and Architects, of the American Institute of Electrical Engineers, and of other learned societies.

ZICKLER, Charles. Born September 16, 1860, at Karlsbad (Bohemia).

After studying at the Realschule at Komotau (Bohemia), and afterwards at the German Technical High School at Prague, he became assistant at the Staatsgewerbeschule at Bielitz (Moravia). In the year 1884 he was appointed assistant and

Digitized by Google

in 1890 engineer at the Electrotechnical Institute newly established at the Vienna Technical High School. In the same year he was also made a Privat-Docent there. In the year 1891 he was appointed professor of electrical engineering at the Technical High School at Brünn (Moravia), where he is charged with the establishing of an Electrotechnical Institute. Herr Zickler is the author of a book on "Electric Firing," and of numerous scientific Papers chiefly dealing with "Electromagnetism" and a new method of calculating and designing dynamo-electric machines. The more important of his Papers are—"On the Curves of Magnetisation of Iron and Steel, and their Relation to Hardness and Carbonisation" (*Centralblatt für Elektrotechnik*, 1886); "On Herr Frölich's Theory of Compound-Wound Dynamos" (1887); "On the Predetermination of Dynamo-Electric Machines of Different Sorts" (1888); "Researches on Electromagnetism with Relation to Frölich's Formula" (1889).

ZIPERNOWSKY, Prof. Charles. Born at Vienna in the year 1853.

Mr. Zipernowsky is the son of a merchant. He was educated at Budapest, where, after finishing the gymnasium, he studied chemistry. He went in 1872 to the Royal Polytechnicum, where he took up the science of mechanical engineering. During the first year of his technical studies he was also employed as a draughtsman in the offices of the Austrian States Railway Company. In 1877 he took the degree of an Engineer, and was privately employed for some months in making electrical apparatus, an occupation he had already begun during the last year of his University scholarship. Since 1878 he has been engaged as an engineer by the firm of Ganz and Co., Budapest, where he made in the same year the first continuous-current dynamo in Hungary, and the first alternating-current dynamo, which is manufactured by the firm in a similar form up to the present time. In 1880 Mr. Zipernowsky made, and took letters patent for, a dynamo with consequent magnet poles producing direct and alternating high frequency and high tension currents, and he has since made a number of inventions in electrotechnics, many of which have attained great popularity. The more important are:—Electrical arc lamp, with variable light power, 1881; a direct, alternating, and differential phase current generator, with one or more circuits, 1881; self-exciting alternating-current dynamo, 1882; a large alternator directly connected to a steam-engine, 1883; rotating secondary generator, 1884; a self-exciting multipolar dynamo, producing direct, alternate and differential phase currents of constant tension or constant quantity, 1884; improved induction apparatus for the transformation of electric currents (transformers), 1885; dynamo compensator, 1885; improvements in distributing electricity (parallel working of transformers), 1885; improvements in regulating alternating currents, 1886; improvements in armatures of dynamos, 1887; improvements in measuring apparatus for electric currents, 1887; dynamo electric brake regulator, 1887; improvements in manufacturing electric accumulators, 1887; improvements in alternating-current dynamos, 1887; method of hardening springs by electricity, 1888; improvements in driving dynamos for the illumination of railway trains, 1888; electric current converting apparatus (from alternating current into continuous, and *vice versâ*), 1888; improvements in distributing electric energy with differential phase currents, 1888; improvements in fittings for electric currents, 1888; improvements in armatures of dynamo-electric machines or motors, 1888; railway with vertical track and conduit, and rolling stock therefor, 1889; improvements in alternating current motors, 1889; conduit mains and contact arrangement for electric railways, 1889; railway switch, 1889; heating and soldering electrically by imperfect contacts, 1890; rolling stock for tramways or railways (motor trucks), 1890; distribution system with alternating and continuous currents by means of rotary converting appliances and accumulators, 1890; system of supplying currents to electric railways and other appliances from central stations, and in connection therewith a new rapid transit electric railroad, 1891; distributing differential phase currents to overhead or underground-conduit electric railways, and to lighting plants, 1891; an active electric wire-obstacle (bar) for military purposes, 1891; a friction clutch, 1892. In some of these inventions he has worked in conjunction with Mr. Déri or Mr. O. T. Bláthy, and in some cases with both these gentlemen. In 1893 Mr. Zipernowsky was elected Corresponding Member of the Royal Hungarian Academy of Sciences, and was in the same year appointed Professor of Electrotechnical Science in the Royal Hungarian Polytechnic Academy in Budapest.

APPENDIX TO BIOGRAPHICAL SECTION.

Below we give those Biographical Sketches which have been returned to us too late for proper classification; and we take this opportunity of expressing our regret that the gentlemen to whom these sketches refer do not render us that assistance which is so essential in a work of this character. Some of the sketches which follow only reached us in the second week in January, which, as our readers will understand, does not give us an opportunity of including them in the ordinary list. In other cases the sketches have not been returned to us at all; and this will account for the absence of several of the memoirs which have previously figured in these pages.

The Biographical Division of this Annual is, we have every reason to believe, thoroughly appreciated, as a proof of which we refer our readers to the very full memoirs of many leading men of Electrical Science, which have been specially written or revised for this HANDBOOK.

BRUSH, Charles Francis, M.E., Ph.D., Electrical Engineer, Cleveland, U.S.A. Born March 17, 1849.

Mr. Brush is of purely English descent, his parents' families having come from England in 1630 and 1656. In 1862, when aged but thirteen years, Mr. Brush made his first experiments with magnets and batteries; and while at the High School, in 1864, he became much interested in the subject of microscopes and telescopes, making a number of them for himself and his companions. He constructed every part of these instruments, even to grinding the lenses. In the same year he devised a plan for turning gas on in the street lamps, lighting it, and then turning it off again, by electricity. He also constructed a number of induction coils, and greatly amused himself and his schoolmates by experiments with them. Having graduated in a four years' course at the Cleveland High School in two and a half years, and continuing to show a fondness for physics and other studies of a similar nature, he entered the University of Michigan at Ann Arbor, where he took up a course of study particularly suited to his tastes, and by diligent attention to his tasks he graduated as a mining engineer in 1869, being one year in advance of his class. Returning to Cleveland from college, he organised a laboratory and conducted the business of an analytical chemist for about three years, becoming noted for the accuracy of his work and the skill displayed in his manipulation. In the spring of 1873 Mr. Brush formed a partnership with Mr. C. E. Bingham, of Cleveland, for the purpose of handling and marketing Lake Superior and other pig-irons and iron ores. While engaged in this business, Mr. Brush resumed his electrical investigations, and early in 1876 completed his first dynamo-electric machine. This machine was of a distinctly new type, and embodied the first of Mr. Brush's series of inventions. Early in 1877 Mr. Brush closed his partnership with Mr. Bingham, and from that date devoted his entire attention to electrical invention. At that time he also made a contract with "The Telegraph Supply Company," of Cleveland, by the terms of which that Company undertook the manufacture and sale of electric light and other apparatus patented to him, paying him a royalty thereon. In 1881 the name of this Company was changed to "The Brush Electric Company," and its capital stock greatly increased. Early in 1877 Mr. Brush invented and constructed his first commercial arc lamp, and exhibited it in connection with one of his new type of dynamos at the Franklin Institute of Philadelphia, where both pieces of apparatus carried off all the honours, in competition with the other best-known lamps and dynamos of that period. Soon after this Mr. Brush invented his series arc lamp, having a regulating shunt circuit of high resistance. Among Mr. Brush's other inventions of early date may be mentioned his copper-plated carbons for arc lights, his automatic cut-out for arc lamps, his series-shunt winding for dynamo-electric machines, and his multiple carbon arc lamp for all-night burning. The patent covering this important invention has recently been sustained by the United States Courts. Mr. Brush at an early date completed his fundamental storage-battery invention, consisting in the mechanical application of the active material to the electrodes; and subsequently, after four years of constant litigation in the Patent Office, obtained patents therefor. The issue of these patents was followed by nearly four years more of fierce litigation in the United States Courts, which has recently resulted in the complete vindication of his claims, securing to Mr. Brush the honour of this great invention. Mr. Brush may justly be considered the father of

Digitized by Google

the arc electric lighting industry of the world. Mr. Brush patented many of his earlier inventions abroad, and in 1880 sold these patents to a London company formed for the purpose of exploiting them, and known as the Anglo-American Brush Electric Light Corporation. He received in payment both cash and stock of the corporation, the subsequent sale of which, together with the cash payment, realised about a half-million of dollars—a price for patents then almost unprecedented. Mr. Brush's house in Euclid-avenue, Cleveland, is very appropriately lighted by electricity, the power being furnished by an enormous windmill located in the park at the rear of the house, and about five hundred feet distant. Mr. Brush is a self-taught mechanic, and is able to do shop work equal to the best trained men. He is intensely practical, and is an excellent business man in the management of his own affairs. Mr. Brush is of excellent physique, being six feet two inches in height, and broad-shouldered in proportion. In 1869 the University of Michigan conferred upon him the degree of M.E. In 1880 the Western Reserve University invested him with the degree of Ph.D.; and in 1881, in connection with the Electrical Exposition held in Paris in that year, the French Government decorated him Chevalier of the Legion of Honour. In 1885 he was elected Fellow of the American Association for the Advancement of Science.

COCKBURN, Arthur C., F.C.S., M.I.E.E. Born at Richmond, September 19, 1859; educated chiefly at Harrow.

After leaving Harrow, he became an articled pupil to an architect and surveyor, serving his time and assisting in carrying out the erection of many important buildings. During this period he developed a natural taste for the sciences, and spent the whole of his spare time in studying the various branches, and obtaining numerous certificates from the Kensington Science and Art Department. This led to his architectural profession being given up, and after two years' further study he obtained an assistantship in the Physical Section of the Science Department of the Harrow School. He occupied this post for two years, when he resigned to take up the study of analytical chemistry and research work, at the renowned laboratory of Dr. John Muter, M.A., F.C.S., at Kennington Oval. From thence, in February, 1880, he obtained the post of Demonstrator in the Electrical Engineering Department of the Finsbury Technical College, under Prof. Ayrton, and afterwards under Prof. S. P. Thompson, covering a period of eight years. In the early part of this appointment he took an active part in furthering the development of the scheme for technical education, and largely assisted in designing the fittings for the present college. In the same year of his entry to the college (1880) he was elected Fellow of the Chemical Society and member of the Society of Telegraph Engineers. In 1887 Mr. Cockburn invented the now well-known Cockburn Patent Cut-Out, or Safety Fuse, reading a Paper on the same before the Telegraph Engineers, which Paper obtained the Society's premium for that year; after which, in connection with Mr. E. Thomas, he brought out the Cockburn-Thomas "Lock-Switch."

At the end of the year 1888 Mr. Cockburn resigned his position at the Finsbury College to enable him to accept the managership of the Acme Electric Works, which he left in August 1890, to enter the firm of Messrs. D. Hulett and Co. as manager of their electrical department. In 1889 he was elected life member of the Physical Society of London.

CROSBY, Oscar T., is a native of Louisiana, where he was born 30 years ago, and passed most of his boyhood in Brookhaven, Miss. From there he entered the U.S. Military Academy in 1878, and four years later graduated second in rank in a large class.

On graduation, Mr. Crosby was commissioned as an officer in the engineer corps, and was stationed at Willetts Point, N.Y., where the torpedo system of the United States service has been developed. After two years spent in the study of this and other problems in military engineering, Lieutenant Crosby was sent to New Orleans for river and harbour duty. He remained at that station for two years engaged in planning and executing various works of improvement. In May, 1887, he obtained six months' leave of absence, and soon after resigned and joined the Sprague Railway and Motor Company in time to take an active part in the early development of electrical traction. He soon assumed the duties of superintendent of the company, and in that capacity was in charge of its manufacture and installation departments. He remained in the service of the Sprague Company for two years and a half, and in the course of his professional work executed various researches on the problems involved in electric railroading. With the advantage of the splendid training acquired by these years of investigation and experience, he undertook the engineering of the Weems Electric Railway Company, and has fully reported to the American Institute of Electrical Engineers the interesting results attained at speeds reaching 120 miles per hour. In December, 1890, Mr. Crosby accepted the position of general manager of the Railway Department of the Thomson-Houston Electric Company, with headquarters in Boston, Mass., U.S.A. Since the organisation of the General Electric Company, by the consolidation of the Edison General Electric Company and the Thomson-Houston Electric Company, Mr. Crosby has been general manager and also head of the Power Transmission Department of the General Electric Company. He wrote, as associate author with Dr. Louis A. Bell, "The Electric Railway in Theory and Practice," published in December, 1891, and which has been well received in this country as well as in America. In connection with Lieut. Ruckman, Fifth U.S. Artillery, he also developed the Ruckman-Crosby Range and Position Finder, which has been adopted by the Board of Ordnance and Fortifications of the United States.

HICKS, William Mitchinson, Sc.D. (Cantab), F.R.S. Born in Launceston, Cornwall, in 1850.

Mr. Hicks entered St. John's College, Cambridge, in October, 1869, and graduated 7th Wrangler in 1873. After taking his degree he worked under Clerk Maxwell in the recently established Cavendish Laboratory, being one of the first students there. He was elected Fellow of St. John's College in 1876. He resided in Cambridge until 1883, when he was appointed Principal of, and Professor of Mathematics and Physics in, Firth College, Sheffield. On the separation of the two chairs in 1892 he continued to hold the Professorship of Physics, in connection with which he has organised a department for Electrical Technology. He has published several papers, which have appeared in the *Philosophical Transactions*, *Philosophical Magazine*, *Quarterly Journal of Mathematics*, the Reports of the British Association, and other publications. He is also the author of an elementary treatise on Dynamics, now in the third edition.

JONES, John Viriamu, M.A. (Oxon.), B.Sc. (Lond.), Principal and Professor of Physics in the University College of South Wales and Monmouthshire, Cardiff, was born at Pentreporth, near Swansea, in 1856.

Mr. Jones in 1872 passed the matriculation examination of the University of London, being placed first in the Honours division. He then entered University College, London, and graduated Bachelor of Science in 1875, taking the University Scholarship in Geology. In 1874 he obtained a Brackenbury Scholarship in Natural Science at Balliol College, Oxford; in 1877, a First Class in Mathematical Honours in Moderations; in 1879, a first class in the Final Honour School of Mathematics; and in 1880, a first class in the Final Honour School of Natural Science (Physics).

In 1880, he was appointed Demonstrator in the Clarendon Laboratory, Oxford, under Prof. Clifton. In 1881, he became Principal and Professor of Mathematics and Physics in the Firth College, Sheffield; and in 1883, he was elected Principal and Professor of Physics in the newly founded University College of S. Wales and Monmouthshire at Cardiff. Prof. Viriamu Jones is the author of several papers, contributed to the *Transactions* of the Royal Society, the Physical Society, and the British Association, among which, the more important relate to the absolute measurement of electrical resistance, and points connected with it. He is a Fellow of University College, London; a Member of the Royal Institution; a Member of the Council of the Physical Society, and a Member of the British Association Committee for the Determination of Electrical Standards. He has been closely connected with the rapid development of University and Technical Education in South Wales and Monmouthshire.

QUINCKE, Georg. Professor of Physics in the Heidelberg University. Born in Frankfort-on-the-Oder in 1834.

From 1852 to 1858 Prof. Quincke studied in Berlin, Königsberg, and Heidelberg. He took his degree of Doctor of Philosophy in Berlin in 1858; was Lecturer and Assistant-Professor of Physics in the Berlin University from 1859 to 1872; was at the Gewerke-Akademie in Berlin from 1860 to 1872; teacher of chemistry and physics in the Berlin Bau-Akademie from 1862 to 1865; Professor of Physics at the Würzburg University from 1872 to 1875; and since 1875 he has been Professor of Physics at the Heidelberg University. Prof. Quincke is a Fellow of the Royal Societies of London and Edinburgh, an honorary member of the Physical Society of London, of the Philosophical Society of Glasgow, of the Manchester Literary and Physical Society, of the Cambridge Philosophical Society, &c. He has contributed some twenty memoirs to *Poggendorff's Annalen*.

VYLE, Samuel (p. CII.).

It should be mentioned that the telephone exchange at Georgetown, British Guiana, is now supplied with a 400-wire multiple switchboard, and that Mr. Vyle has fitted up an exchange with a 100-wire switchboard at New Amsterdam, some 70 miles from Georgetown.

The Entire System of this Company is Duplexed, making it equal to Four Single the Cables are equipped with Automatic Transmitting Instruments, which materially increase the speed and reduce the liability of error to a minimum.

CONNECTIONS.

POSTAL TELEGRAPH CO.—The greatest competitive system of Telegraphs ever maintained in the United States, covering all commercial points in the country.

CANADIAN PACIFIC TELEGRAPHS.—Reaching all important places in CANADA, from the Atlantic to the Pacific, and the only Company having lines in British Columbia.

"Via COMMERCIAL."

To insure your Cablegrams being forwarded by the ONLY INDEPENDENT Atlantic Cable Company, please mark them "Via Commercial," which indication is not charged for ; or use this Company's own forms, bearing its GLOBE Trade Mark.

This Company's routes avoid all long land lines on **BOTH** sides of the Atlantic.

THE INDO-EUROPEAN TELEGRAPH COMPANY, LIMITED.

Shortest and Most Direct Route to India and the Far East,

BY SPECIAL WIRES.

DIRECT OVERLAND TELEGRAPHS

CONNECTED WITH

INDIA, CEYLON, BURMAH, PENANG, SINGAPORE, AND OTHER PLACES IN THE **STRAITS SETTLEMENTS**, COCHIN-CHINA, SIAM, ANNAM, TONKIN, **CHINA**, PHILIPPINE ISLANDS (MANILA), **JAPAN** (COREA, &c.), **DUTCH INDIES** (JAVA, &c.), **AUSTRALIA, NEW CALEDONIA, NEW ZEALAND, PERSIA, SOUTHERN RUSSIA, TURKEY** (CONSTANTINOPLE AND OTHER PLACES) AND THE **EAST GENERALLY.**

The greatest possible SPEED and ACCURACY in the Transmission of Messages are secured by the VERY LIMITED NUMBER of TRANSMITTING STATIONS on the LINE, by the use of INK-WRITING RECORDING INSTRUMENTS, by the employment of a Special Staff of Skilled ENGLISH TELEGRAPHISTS throughout the Line, and by a System of Control which is exercised over every Message.

MESSAGES ARE ACCEPTED AT THE COMPANY'S OFFICES:

LONDON—18, Old Broad Street, E.C.; 6 and 8, Lime Street Square; and 10 & 11, Mincing Lane, E.C.

LIVERPOOL—Walmer Building, 6, Water Street.

MANCHESTER—60, Spring Gardens.

Where receipts are given gratis for the charges made, and whence messages are sent direct by Special Wire; **messages are also accepted at all Postal Telegraph Offices** throughout the Kingdom.

ALL TELEGRAMS SHOULD BE MARKED "VIA INDO."

No charge is made by any Telegraph Station for the transmission of the "Via."

Books of Forms and Tariff Books, containing Rules and Regulations, Lists of Stations, &c., are forwarded post free on application to the Company's Stations as above, and at the Head Offices, 18, Old Broad Street, London, E.C.

W. ANDREWS, Managing Director.
